Karl Klager, Sacramento, Calif., assignor to Aerojet-General Corporation, Azusa, Calif., a corporation of Ohio
No Drawing. Filed Dec. 21, 1959, Ser. No. 861,138
1 Claim. (Cl. 260—601)

This application is a continuation-in-part of my copending application Serial No. 387,023, filed October 19, 1953 and now abandoned, which was a continuation-in-part of application Serial No. 235,569, filed July 6, 1951, and now abandoned.

This invention relates to a novel method of preparing nitroolefins having the general formula

$$CH_2{=}\overset{NO_2}{\overset{|}{C}}{-}R$$

wherein R is an alkyl, halogen, ω-carboxyalkyl, ω-acyloxyalkyl, ω-carboalkoxyalkyl, cyanoalkyl, or ω-formylalkyl radical, and to nitroolefins prepared thereby.

The nitroolefins prepared by the method of this invention in which R is an ω-acyloxyalkyl radical, such as nitroallyl acetate, readily condense with nitro compounds having a labile hydrogen function, such as methyl 4,4-dinitrobutyrate, to form highly nitrated compounds, such as dimethyl 4,4,6,8,8-pentanitro-1,11-undecanedioate, useful as high explosives. A more complete description of this process can be found in my copending application Serial No. 636,839, filed January 28, 1957 and now Patent No. 3,000,932. In addition, all of the nitroolefins prepared by the method of this invention undergo an addition reaction with polynitro compounds having a labile hydrogen function, such as 2,2,4,4-tetranitrobutyl acetate, to form highly nitrated compounds useful as high explosives. 2,2,4,4-tetranitrobutyl acetate is disclosed in assignee's copending application Serial No. 617,667, filed October 22, 1956 and now Patent No. 2,978,455. The addition reaction is conducted according to the method set forth in copending application Serial No. 636,839.

The highly nitrated compounds obtained by the above-described methods are useful as high explosives and can be used in any conventional explosive missile, projectile, rocket, or the like, as the main explosive charge. An example of such a missile is disclosed in United States Patent 2,470,162, issued May 17, 1949. One way of using the high explosives of this invention in a device such as that disclosed in United States Patent 2,470,162 is to pack the crystalline explosive in powder form into the warhead of the missile. Alternatively, the crystals can be first pelletized and then packed. A charge thus prepared is sufficiently insensitive to withstand the shock entailed on the ejection of a shell from a gun barrel or from a rocket launching tube under the pressure developed from ignition of a propellant charge, and can be caused to explode on operation of an impactor time-fuse mechanism firing a detonating explosive such as lead azide or mercury fulminate.

The novel method of this invention comprises the simple pyrolysis of nitro-substituted endo anthracene compounds to decompose them into anthracene and the corresponding nitroolefins, in accordance with the general reaction scheme set forth below:

wherein R is as defined above.

The pyrolysis is preferably conducted under a vacuum so as to avoid the possibility of undesirable oxidation. The heat, as may be seen above, breaks the nitroolefin-anthracene bonds to yield anthracene and the desired nitroolefins.

2

The following examples are provided to more clearly illustrate my invention. It should be understood, however, that these examples are provided purely for purposes of illustration and are not intended to limit the scope of the invention in any way.

EXAMPLE I

Preparation of methyl-4-nitro-4-pentenoate

One part of 11-(2-carbomethoxyethyl)-11-nitro-9,10-ethanoanthracene was heated in vacuum at 21 mm. to 185–200° C. A slightly yellow colored liquid was distilled and condensed in a receiver. The weight was 0.28 part of the starting material. At 230–240° C., at the same pressure, 0.62 gm. solid material distilled which was identified as anthracene (M.P. 215° C., mixed melting point 215° C.). The first fraction was redistilled at 96° C. and 4 mm. The analysis indicated that methyl-4-nitro-4-pentenoate was formed, $n_D^{24}=1.4612$.

EXAMPLE II

Preparation of nitroallyl acetate

A bulb tube charged with 1 gm. 11-acetoxymethyl-11-nitro-9,10-ethanoanthracene, prepared by acetylation of 11-methylol-11-nitro-9,10-ethanoanthracene with acetic anhydride, M.P. 103–105° C., was heated to 200–220° C. at 29 mm. in an airbath. Decomposition was observed and a greenish-yellow liquid distilled, accompanied by crystals. After redistillation at 90–120° C. airbath temperature and 5 mm. the light-yellow liquid (0.1 gm.) gave the following analysis for nitroallyl acetate:

Analysis.—Calc'd for $C_5H_7O_4N$: percent C, 41.38; percent H, 4.86; percent N, 9.65. Found: percent C, 41.53; percent H, 5.45; percent N, 8.83.

The anthracene fraction was purified by crystallization from tetrahydrofuran and methanol. The melting point and mixed melting point with pure anthracene were 214–216° C.

EXAMPLE III

Preparation of 4-nitro-4-pentenonitrile

A bulb tube was filled with 0.8 gm. 11-(2-cyanoethyl)-11-nitro-9,10-ethanoanthracene and heated to 195–200° C. at 28 mm. A yellow liquid and crystals distilled. The distillate was dissolved in ether and filtered from the insoluble anthracene. The extract was evaporated and distilled at 120° C. airbath temperature and 5 mm. producing a greenish-yellow liquid with a refractive index, n_D^{22} 1.4735.

Analysis.—Calc'd for $C_5H_6O_2N_2$: percent C, 47.61; percent H, 4.80; percent N, 22.22. Found: percent C, 47.97; percent H, 4.94; percent N, 22.62.

The ether insoluble portion was crude anthracene. It was dissolved in tetrahydrofuran and methanol was added. After two recrystallizations the melting point was 213–214° C. and the mixed melting point with anthracene (M.P. 214–216° C.) was 214–216° C.

It will be apparent that any nitroolefin within the scope of the general formula given above can be prepared by heating the corresponding nitro-substituted 9,10-ethanoanthracene in the manner described in the above examples. For example, 2-nitro-1-butene; 2-nitro-1-hexene; 2-nitropropylene; 1-chloro-1-nitroethylene; 1-bromo-1-nitroethylene; 1-fluoro-1-nitroethylene; ethyl-4-nitro-4-pentenoate; methyl-2-methyl-3-nitro-3-butenoate; 4-nitro-pentenoic acid; and 4-nitro-4-pentenal can be prepared by heating 11-ethyl-11-nitro-9,10-ethanoanthracene; 11-butyl-11-nitro-9,10 - ethanoanthracene; 11-methyl-11-nitro-9,10-ethanoanthracene; 11-chloro-11-nitro-9,10 - ethanoanthracene; 11-bromo-11-nitro-9,10-ethanoanthracene; 11-fluoro-

COMPLETE SPECIFICATION

Polynitro-Substituted Dibasic Acids and Esters

We, AEROJET-GENERAL CORPORATION, a corporation duly organized and existing under the laws of the State of Ohio, United States of America, of 6352 North Irwindale Avenue, Azusa, State of California, United States of America, do hereby declare the invention, for which we pray that a patent may be granted to us, and the method by which it is to be performed, to be particularly described in and by the following statement:—

This invention relates to new compounds, and in particular, to polynitro-substituted dibasic acids and esters thereof having the general formula:

$$RO-\overset{O}{\overset{\|}{C}}-A-\underset{NO_2}{\overset{NO_2}{C}}-CH_2-\underset{X}{\overset{NO_2}{C}}-CH_2-\underset{NO_2}{\overset{NO_2}{C}}-A-\overset{O}{\overset{\|}{C}}-OR$$

wherein R is an alkyl group or hydrogen atom, A is a lower alkylene radical and X is hydrogen atom or nitro radical. By the term "lower alkylene radical" we mean an alkylene radical having from 1 to 4 carbon atoms.

The new compounds of this invention are prepared by condensing esters of nitroallyl alcohol with ω,ω-dinitroalkanoic acids or esters thereof, and in accordance with the general reaction scheme set forth below:

$$H_2C=\overset{NO_2}{C}-CH_2-O-\overset{O}{\overset{\|}{C}}Y+2H-\underset{NO_2}{\overset{NO_2}{C}}-A-\overset{O}{\overset{\|}{C}}-OR$$

$$\downarrow M^+$$

$$RO-\overset{O}{\overset{\|}{C}}-A-\underset{NO_2}{\overset{NO_2}{C}}-CH_2-\overset{NO_2}{CH}-CH_2-\underset{NO_2}{\overset{NO_2}{C}}-A-\overset{O}{\overset{\|}{C}}-OR \qquad (I)$$

$$\downarrow HNO_3$$

$$HO-\overset{O}{\overset{\|}{C}}-A-\underset{NO_2}{\overset{NO_2}{C}}-CH_2-\underset{NO_2}{\overset{NO_2}{C}}-CH_2-\underset{NO_2}{\overset{NO_2}{C}}-A-\overset{O}{\overset{\|}{C}}-OH \qquad (II)$$

$$\downarrow R'OH$$

$$R'O-\overset{O}{\overset{\|}{C}}-A-\underset{NO_2}{\overset{NO_2}{C}}-CH_2-\underset{NO_2}{\overset{NO_2}{C}}-CH_2-\underset{NO_2}{\overset{NO_2}{C}}-A-\overset{O}{\overset{\|}{C}}-OR' \qquad (III)$$

wherein R is hydrogen or alkyl, Y is an organic radical, preferably alkyl, M is an ion of an alkali or alkaline earth metal, A is a lower alkylene radical and R^1 is an alkyl radical.

In place of the ester of nitroallyl alcohol, a diester of 2 - nitro - 1,3 - propanediol can be used, as for example, 2 - nitro - 1,3-diacetoxypropane. It is believed that the diester generates the nitroallyl alcohol ester *in situ* and then reacts in the manner illustrated above.

Since the acid portion of the nitroallyl ester does not enter into or affect the reaction, Y can be any organic radical including phenyl, benzyl, heterocyclic, aliphatic, cycloaliphatic, or the like, without departing from the scope of the invention. Similarly, when a diester of 2 - nitro - 1,3 - propanediol is used as the starting material, the acid portion can be any organic acid inasmuch as this portion of the diester does not enter into or affect the reaction in any way.

R, the alcohol portion of the dinitroalkanoic acid ester is an alkyl radical. Likewise, the dibasic acids of this invention will react with any organic alcohol to form esters in the usual manner.

The corresponding dibasic acid is prepared by hydrolysis of the alkyl ester with a strong acid which is sulphuric acid, hydrochloric acid, hydrobromic acid, phosphoric acid, trifluoroacetic acid or mixtures thereof in the conventional manner. The reaction of compound (I) with nitric acid produces the hexanitro deriva-

[57] **ABSTRACT**

Hybrid rocket propellants are disclosed that contain azo compounds, i.e., compounds containing the group R—N═N—R' as part of their structure, where R and R' represent a variety of groups including aliphatic, alicyclic and heterocyclic groups. The azo compounds are mixed with the other solid components of the propellant grain and serve either as plasticizers, binders, fuels, or fillers. The effect of including the azo compounds is an increase in the regression rate of the grain as the propellant burns.

David Beers. 1996. *Blue Sky Dream: A Memoir of America's Fall from Grace.* [Beers 1996, pp. 38–39]

"The most beautiful missiles ever fired," a U.S. Navy Rear Admiral pronounced the nuclear-tipped A1X Polaris, having witnessed its successful submarine test on a summer day in 1960. The fully evolved, deployed Polaris, designed under the guidance of Wernher von Braun's friend and fellow former Nazi, Wolfgang Noeggerath, was capable of traveling 2,400 nautical miles in a few minutes and delivering, from its elusively mobile launchpad, three separate warheads to a single target deep within the Soviet Union—facts no doubt beautiful to a nuclear warfare strategist.

[The journalist David Beers, who grew up surrounded by the research of his father and his father's coworkers at Lockheed, singled out the importance of Wolfgang Noeggerath for the Polaris solid-propellant missile.]

Baltimore Sun 2000-11-29. Werner W. Hohenner, 93, Scientist Who Helped Develop Polaris Missile [https://www.baltimoresun.com/news/bs-xpm-2000-11-29-0011290120-story.html].

[...] From 1947 until 1954, Mr. Hohenner was at the Point Mugu Naval Air Weapon Station in California, working in the Naval Ballistic Program that led to the development of the Polaris missile, the first U.S. submarine-launched ballistic missile.

During the rocket's development, Mr. Hohenner prevailed over Mr. von Braun, who insisted that the rocket be fueled by liquid rather than solid fuel.

"He brought a great knowledge ... in fuel handling, and convinced the Navy that if they followed von Braun's plan to use liquid fuel, which is dangerous, they could plan on losing a sub a year in accidents," said Robert L. Frohmuth, a retired Navy electrical engineer. "It was a breakthrough, and he was the one who got solid fuel missiles started, which are still being used today."

"His greatest achievement was the development of the Polaris," said Mr. Schmitz.

From 1957 until retiring in 1973, Mr. Hohenner was chief scientist at the air arm division at the Westinghouse plant in Linthicum, where he continued his work on weapon systems and ballistic missiles.

[The *Baltimore Sun* reported the death of another German scientist who played an important role in the development of the Polaris missile, which was confirmed in the later *Los Alamos Daily Post* article below.]

***Los Alamos Daily Post.* 2013-04-10. Rosmarie H. Frederickson.**
[https://ladailypost.com/new-living-treasures-of-los-alamos-unveiled/]

Rosmarie H. Frederickson was born in Germany and came to the US at age 12. She is the daughter of scientist Werner W. Hohenner who was able to bring his family to the US after the war, and once here he was able to help develop the Polaris missile. [...]

The Birth and Boyhood of Point Mugu by Captain Grayson Merrill, USN (Ret). 2003.
https://www.usna.com/tributes-and-stories—stories-1934
http://stagone.org/?page_id=28 [Merrill 2003]

Shortly after this I was detailed to witness some V-2 firings at Cuxhaven staged by the British and executed by Germans from Peenemunde. It reinforced, in my mind, the correctness of choosing Point Mugu. After the firings a small group of American observers gathered in a Bremen rathskeller to quaff beer and discuss what we had seen. A rumpled fake Army Colonel named Theodore von Kármán summed up our feelings, “You young fellows must now go home and arrange to put these Germans to work. In the meantime build a test range for the missiles to come.”

Almost 20 years later it can be said that Point Mugu has borne out the committee’s judgments. [...]

Many of the LOON technical successes are traceable to the “German Scientists” who migrated to Point Mugu. These included Willy Fiedler, Robert Lusser and Otto Schwede. But Dr. Herbert A. Wagner, now deceased, deserves special mention. [...]

I left in 1949 but nevertheless watched with pride as the range expanded in support of such missiles as LARK, SPARROW, REGULUS, RIGEL, POLARIS and TOMAHAWK.

[Grayson Merrill, a retired Navy Captain, also emphasized the central role of German-speaking scientists in the missile programs.

For considerable documentation on Willy Fiedler’s aerospace work in both Germany and the United States, see https://earlyflightera.com/from-fledermaus-to-polaris/]

INVENTOR.
HERBERT A. WAGNER
BY
ATTORNEYS

Figure E.250: A patent on missile guidance systems for the U.S. Navy by Herbert Wagner.

Marsha Freeman. 2003. Arthur Rudolph and the Rocket That Took Us to the Moon. 54th International Astronautical Congress of the International Astronautical Federation, the International Academy of Astronautics, and the International Institute of Space Law. IAC-03-IAA.2.1.02 [https://www.scientistsandfriends.com/files/arthur.pdf].

In 1956, the decision was made that the U.S. Army needed a "shoot and scoot" mobile missile, which meant it had to be solid-fueled. This was the Pershing program.

Arthur Rudolph was made the project director, with $500 million for its development. He assembled a team, and took bids. He visited the potential contractors in person, and, knowing the guidance system was critical, chose the Bendix plant in New Jersey for the job. After inspecting their facilities, he noted that it had the best precision machine tools for the job, which were made in Germany! "That was the firm for us!" he decided.

The creed that Arthur Rudolph developed to manage the Pershing rocket was that "nothing could fall through the cracks." Research and development laboratories were expanded for testing vibration, hearing, and other conditions that would face the rocket in flight.

Following the uproar after the Soviet launch of Sputnik in November 1957, the National Aeronautics and Space Administration (NASA) was established. The heart of the new civilian space program would be rockets, and the von Braun team was transferred from the Army—all but Arthur Rudolph. He was considered irreplaceable on the Pershing program.

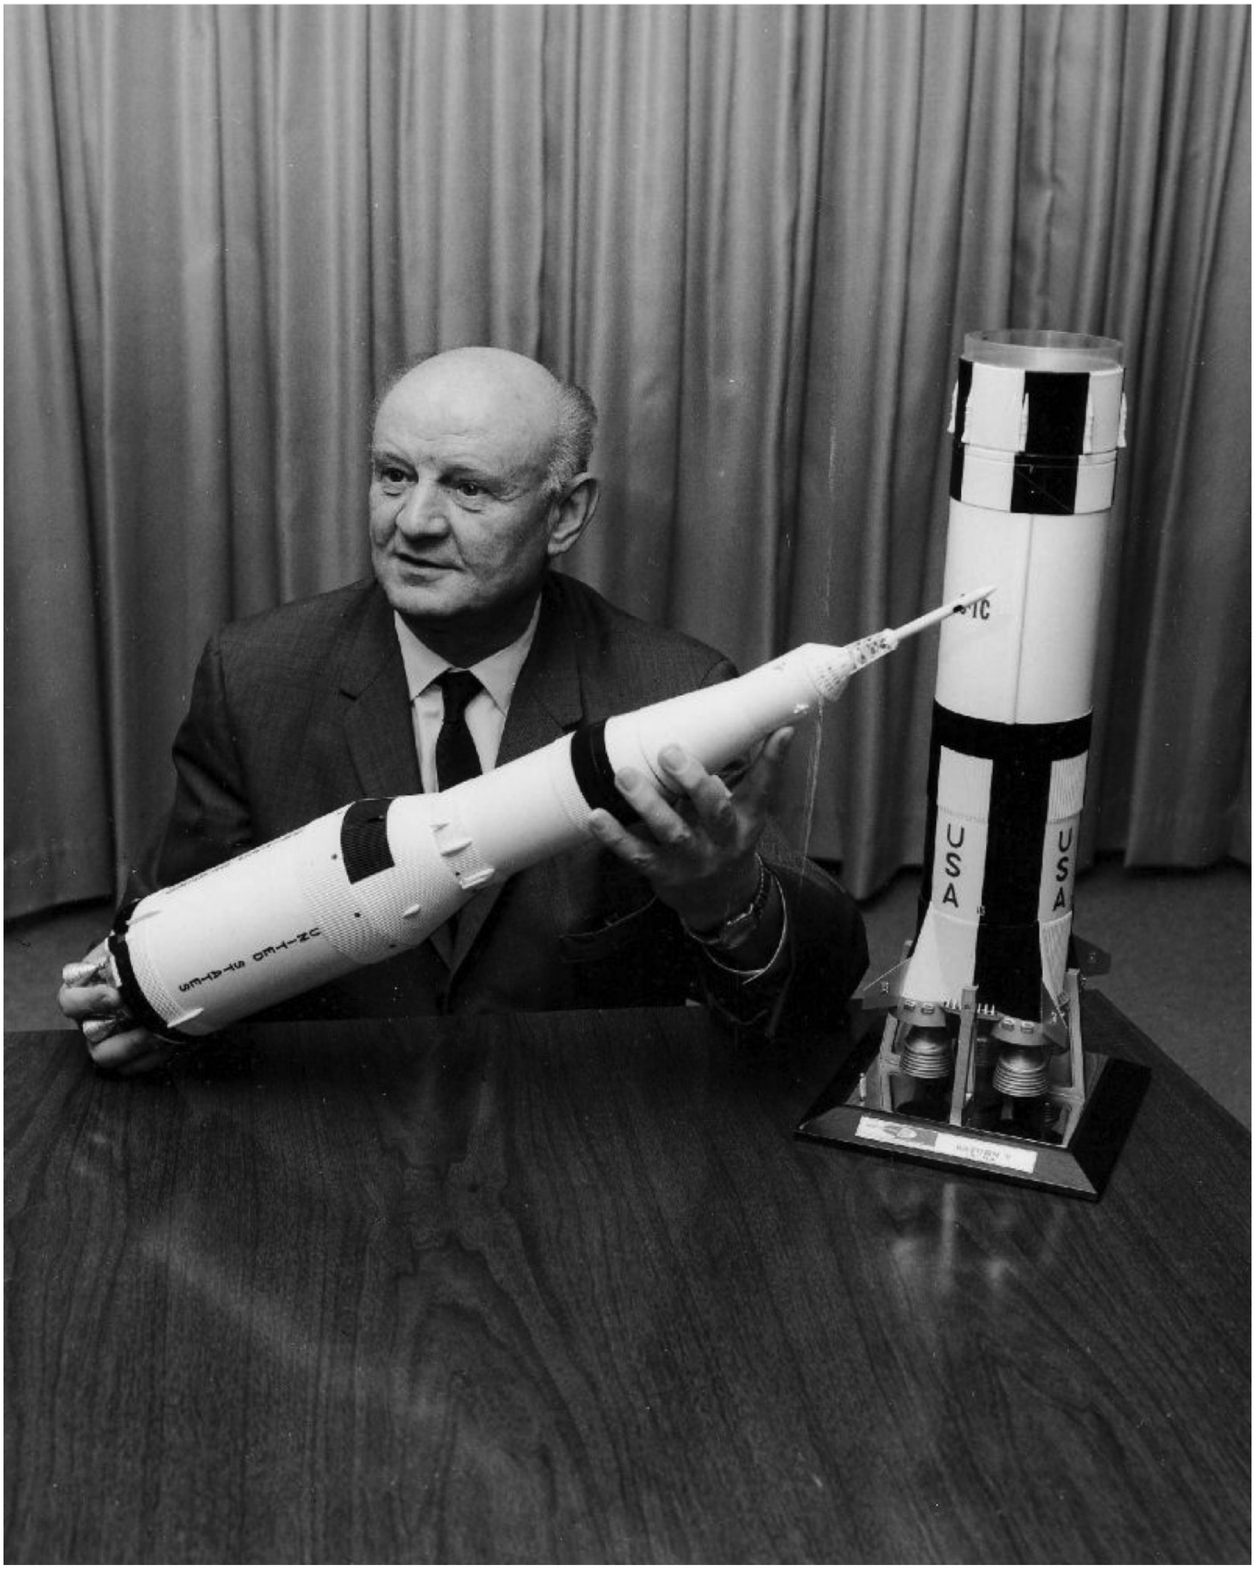
In 1960, Arthur Rudolph, for his management of the Pershing missile program, received the Exceptional Civilian Service award, the highest civilian award in the Army. [...]

In 1962, at a meeting at NASA headquarters in Washington, Arthur Rudolph put forward his list of basic requirements for the Apollo rocket, and a mission plan that was based on his experience managing the Pershing program. In 1963, he was named the program manager for the Saturn V. [...]

Arthur Rudolph's management of the massive Saturn V rocket program involved his personal tracking of all of the aspects of the system. He had a chart in his office showing all of the components, large and small, to be able to immediately see their progress. This made the entire program transparent, and provided an overview of the massive coordination. Every problem was dealt with, in excruciating detail, by the program manager and his staff. [...]

For his management of the Saturn V program, Arthur Rudolph received both the Exceptional Service Medal and the Distinguished Medal from NASA.

His job of developing and producing the rocket to take men to the Moon completed, Arthur Rudolph retired from the space agency, and rocket research, on January 1, 1969.



Arthur Rudolph (1906–1996) managed the development of the Pershing 1 missile and then the Saturn V rocket

E.5 Longer-Term Space Projects

[The prevailing public perception is that technologies for space exploration were developed by the United States and the Soviet Union, beginning with the October 1957 launch of the Soviet Sputnik satellite. However, scientists in interwar and wartime Germany did a great deal of work on technologies for space exploration, and continued to develop those technologies in other countries after World War II:

- Walter Hohmann published a detailed textbook of calculations for spacecraft trajectories and orbits in 1925 [Hohmann 1925]. See pp. 5739–5742.
- In 1928, Hermann Potočnik, under the pen name of "Hermann Noordung," published a book with detailed designs of a large, circular, rotating space station, as shown on pp. 5743–5746 [Noordung 1928].
- Guido von Pirquet and Hermann Oberth separately designed space stations in 1928–1929 [Ley 1928; Oberth 1929]. See Fig. 9.233.
- Plans for a space station were seriously considered by the German government during World War II, especially with regard to potential military applications. See p. 5747.
- There were detailed wartime designs for large three-stage rockets (A-11 through A-15) capable of launching cargo or vehicles into Earth orbit or beyond (p. 5405).
- Scientists at Peenemünde and the Reichspost began programs on fission thermal rocket propulsion no later than 1942 (p. 5757). Creators such as Krafft Ehricke continued those programs in the United States after the war.
- External pulse propulsion by nuclear explosives was first proposed in approximately 1942 by Wernher von Braun. By the end of the war, work in this area had apparently progressed at least as far as creating small test models powered by conventional chemical explosives. After the war, external fission pulse propulsion was explored in the United States by Stanislaw Ulam, another creator from the greater German-speaking world. See p. 5770.
- Electric rocket propulsion systems were first proposed by Hermann Oberth in 1929 (p. 5772). Experimental development of electric propulsion in Germany began no later than 1937 and continued until at least 1944 (p. 5311). Ernst Stuhlinger, Wernher von Braun, and other German-speaking scientists continued to develop and promote electric propulsion after the war (pp. 1958, 5772).
- Eugen Sänger was the first to propose matter-antimatter rockets and to work out their details, including using anti-hydrogen made from positrons and antiprotons, storing the antimatter without letting it come into contact with ordinary matter, and using highly novel types of nozzles to direct the matter-antimatter reaction products out the back of the rocket. See pp. 1956, 1958, and 5773.

These wartime German creators and their creations were directly responsible for the postwar space exploration programs in the United States, Soviet Union, and other countries [e.g., Chertok 2005–2012; Jürgen Michels 1997; Ordway and Sharpe 1979; Uhl 2001].

This section is subdivided into categories of sources that cover:

E.5.1. Orbital spacecraft and space stations.

E.5.2. Fission thermal rocket propulsion.

E.5.3. Fission pulse rocket propulsion.

E.5.4. Electric rocket propulsion.

E.5.5. Antimatter rocket propulsion.]

E.5.1 Orbital Spacecraft and Space Stations

[Walter Hohmann (German, 1880–1945) published a detailed textbook of calculations for spacecraft trajectories and orbits in 1925 [Hohmann 1925]. Figures E.255–E.258 show illustrations from his book for calculations regarding atmospheric reentry, aerobraking, and what are now called Hohmann ellipses—elliptical orbits for transferring from one nearly circular orbit (such as that of a planet) to another (such as that of another planet) with the smallest possible expenditure of energy. The methods that Hohmann proposed and worked out in 1925 have been utilized quite effectively since the 1960s and will continue to be widely used in future space missions.

In 1928, Hermann Potočnik (Austrian/Slovene, 1892–1929), under the pen name of "Hermann Noordung," published a book with detailed designs of a large, circular, rotating space station, as shown in Figs. E.259–E.262 [Noordung 1928]. Potočnik's designs accurately accounted for everything from the solar energy requirements of the space station's power plant to the artificial gravity in its living quarters. His book also incorporated many of Hohmann's proposed methods for interplanetary missions. Unfortunately Potočnik died from tuberculosis (which he had contracted during World War I) when he was only 36; if he had lived he might have helped to realize some of his visions.

Guido von Pirquet (Austrian, 1880–1966) and Hermann Oberth (German, 1894–1989) separately designed space stations in 1928–1929 [Ley 1928; Oberth 1929]. See Fig. 9.233. Oberth pointed out that such a station could for example tend large space-based mirrors to reflect sunlight on the earth. Depending on they were used, such mirrors might improve everything from agriculture to power production to weather, or they might incinerate opposing countries.

Plans for a space station and space mirror were seriously considered by the German government during World War II, especially with regard to potential military applications [NYT 1945-06-29 p. 1, 1945-06-30 p. 3; *Life* 1945-07-23 p. 78; *Time* 1946-09-02 p. 52]. See p. 5747.

There were detailed wartime designs for large three-stage rockets (A-11 through A-15) capable of launching cargo or vehicles into Earth orbit or beyond (see p. 5405). During the war, was any experimental work beyond the drawing board done on any of them—wind tunnel models, rocket engine mock-ups, etc? Considering the evidence for other developments in Appendices A–E, historians should not be too quick to rule out the possibility.]

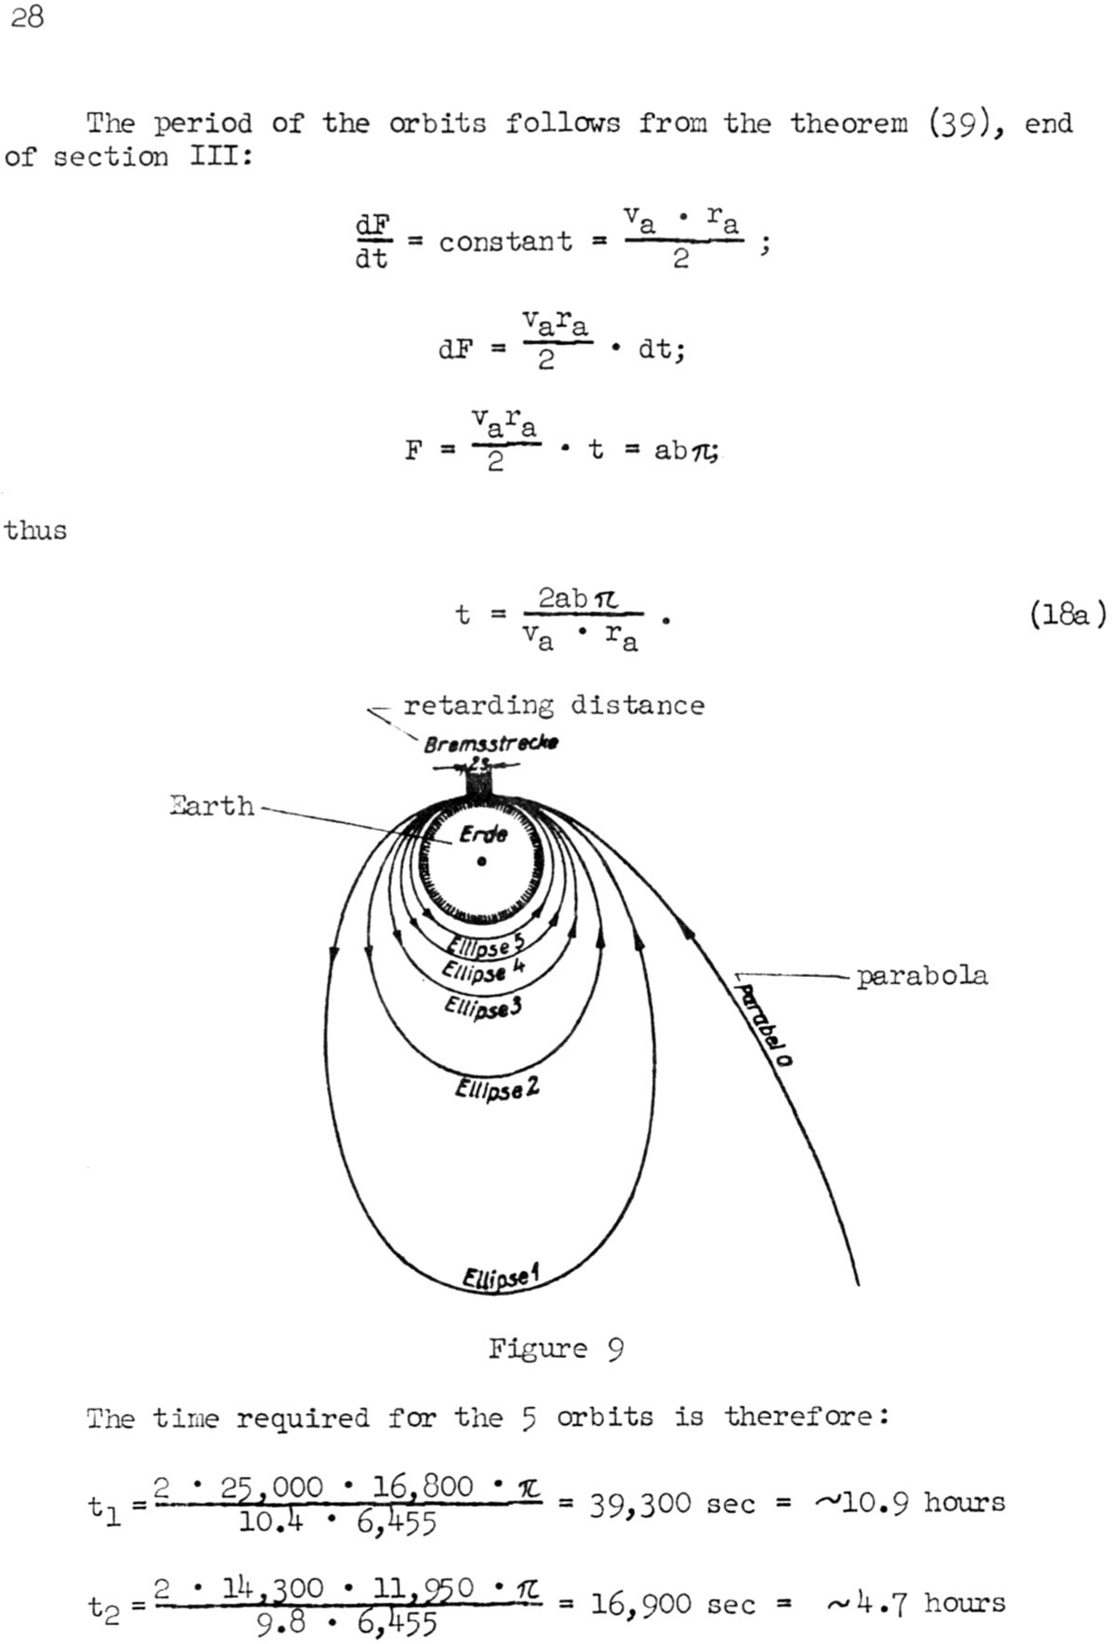
Figure E.255: Walter Hohmann published a detailed textbook of calculations for spacecraft trajectories and orbits in 1925 [Hohmann 1925].



28

The period of the orbits follows from the theorem (39), end of section III:

$$\frac{dF}{dt} = \text{constant} = \frac{v_a \cdot r_a}{2};$$

$$dF = \frac{v_a r_a}{2} \cdot dt;$$

$$F = \frac{v_a r_a}{2} \cdot t = ab\pi;$$

thus

$$t = \frac{2ab\pi}{v_a \cdot r_a}. \tag{18a}$$

Earth
Erde
Ellipse 5
Ellipse 4
Ellipse 3
Ellipse 2
Ellipse 1
parabola
Parabel 0

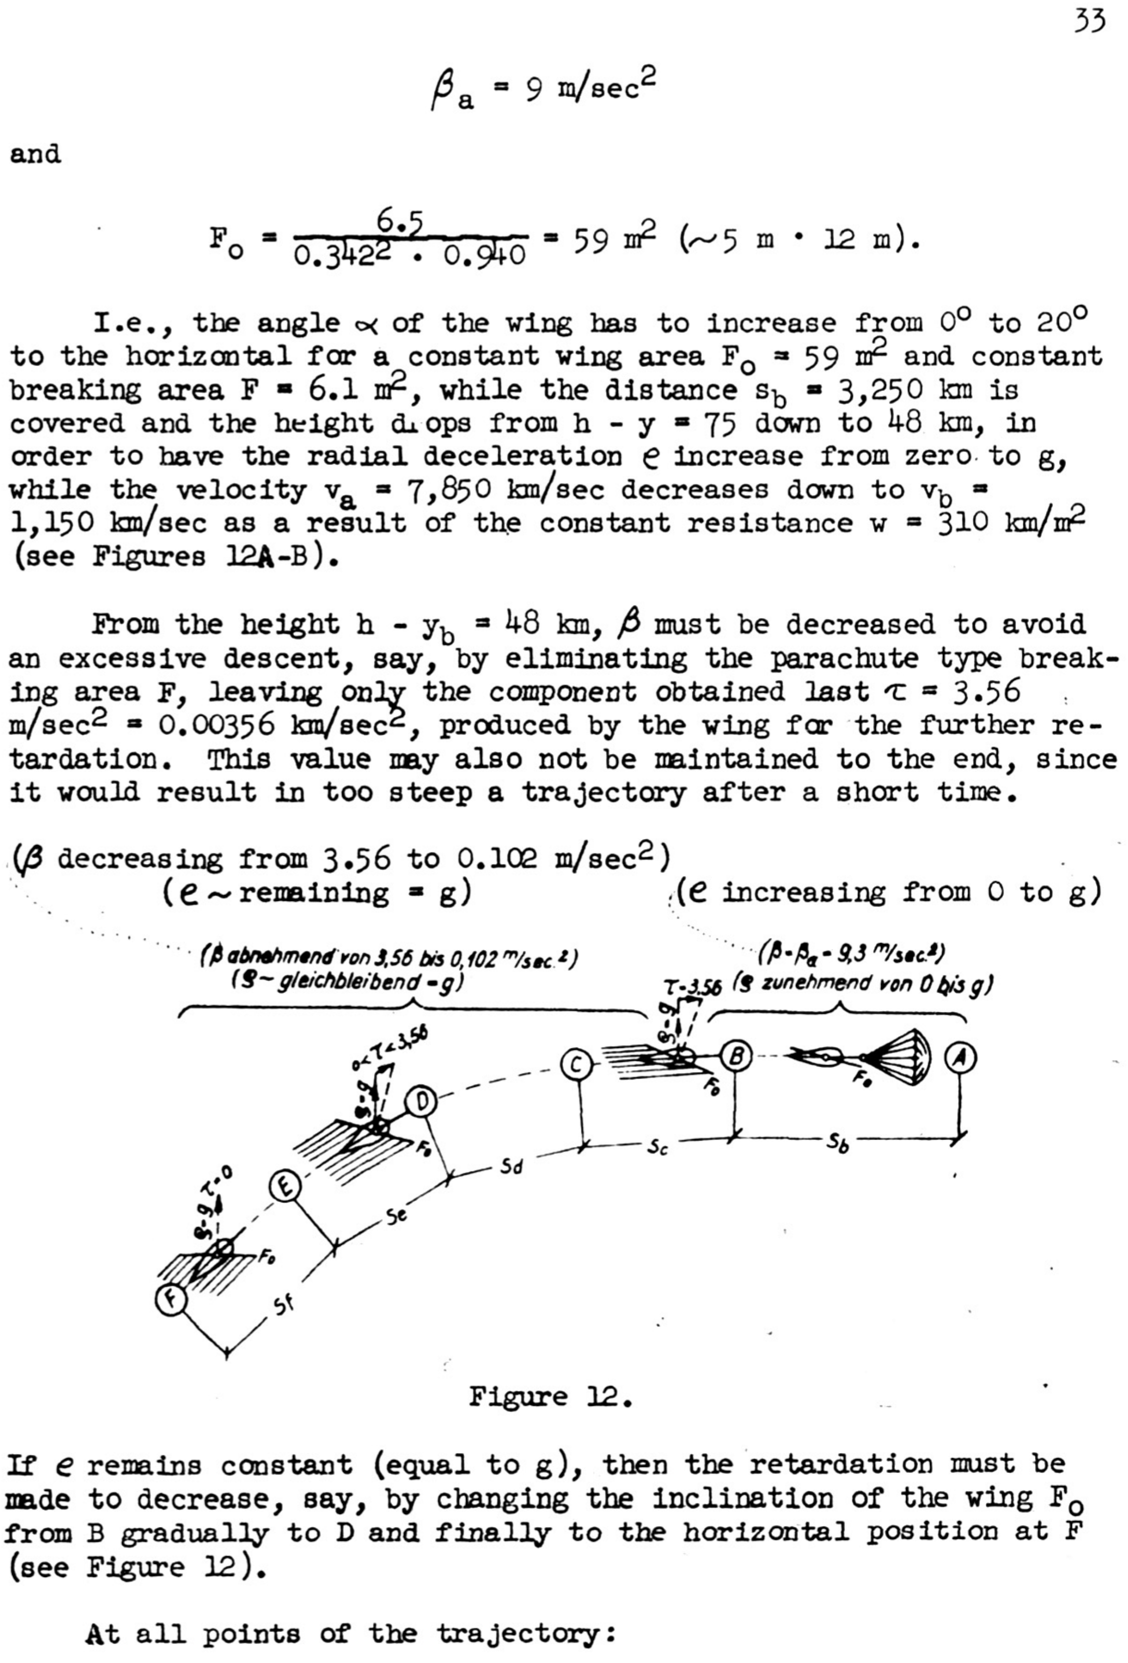
Figure 9

The time required for the 5 orbits is therefore:

$$t_1 = \frac{2 \cdot 25{,}000 \cdot 16{,}800 \cdot \pi}{10.4 \cdot 6{,}455} = 39{,}300 \text{ sec} = \sim 10.9 \text{ hours}$$

$$t_2 = \frac{2 \cdot 14{,}300 \cdot 11{,}950 \cdot \pi}{9.8 \cdot 6{,}455} = 16{,}900 \text{ sec} = \sim 4.7 \text{ hours}$$

Figure E.256: Walter Hohmann proposed and calculated aerobraking maneuvers to slow an interplanetary spacecraft by briefly dipping into the atmosphere of the target planet [Hohmann 1925].



$$\beta_a = 9 \text{ m/sec}^2$$

and

$$F_o = \frac{6.5}{0.342^2 \cdot 0.940} = 59 \text{ m}^2 \ (\sim 5 \text{ m} \cdot 12 \text{ m}).$$

I.e., the angle α of the wing has to increase from 0° to 20° to the horizontal for a constant wing area $F_o = 59 \text{ m}^2$ and constant breaking area $F = 6.1 \text{ m}^2$, while the distance $s_b = 3{,}250$ km is covered and the height drops from h - y = 75 down to 48 km, in order to have the radial deceleration ϱ increase from zero to g, while the velocity $v_a = 7{,}850$ km/sec decreases down to $v_b = 1{,}150$ km/sec as a result of the constant resistance w = 310 km/m² (see Figures 12A-B).

From the height $h - y_b = 48$ km, β must be decreased to avoid an excessive descent, say, by eliminating the parachute type breaking area F, leaving only the component obtained last $\tau = 3.56$ m/sec² = 0.00356 km/sec², produced by the wing for the further retardation. This value may also not be maintained to the end, since it would result in too steep a trajectory after a short time.

(β decreasing from 3.56 to 0.102 m/sec²)
($\varrho \sim$ remaining = g) (ϱ increasing from 0 to g)

Figure 12.

If ϱ remains constant (equal to g), then the retardation must be made to decrease, say, by changing the inclination of the wing F_o from B gradually to D and finally to the horizontal position at F (see Figure 12).

At all points of the trajectory:

Figure E.257: Walter Hohmann proposed and calculated reentry trajectories to slow a spacecraft returning to Earth without creating excessive g-forces from atmospheric drag [Hohmann 1925].

v_{II}
r_{II}
S
r_I
$V_1\ (v_1)$
E_3
(v_e)
E_1
v_I

Figure 25.

Now the Earth velocity is $v_e = 29.7$ km/sec and accordingly the velocity to be imparted to the vehicle, after it reaches its apogee, has to be

$$\Delta v_I = v_I - v_e = 27.3 - 29.7 = - 2.4 \text{ km/sec}$$

and could be the result of a tangential shot of mass

$$\Delta m = m \cdot \frac{\Delta v_I}{c} ,$$

where m is the mass of the vehicle before the shot and c is the velocity of the projectile. In this case, one can no longer use the value of $c = 1$ km/sec, assumed in section III, and also a single shot of the required strength would endanger the vehicle and its passengers. A system of continuous mass radiation as in section I must be used with a min. velocity of $c = 2$ km/sec. We have now for the ratio of total mass before and after the action by (32)

$$\frac{m_o}{m_1} = e^{(\frac{\Delta v}{c})} .$$

But since during the initial parallel paths of planet and vehicle orbit interference is unavoidable, an additional safety factor [see Note], say $\nu = 1.1$, must be added, which necessitates:

$$(\frac{m_o}{m_1})_I = \nu \cdot e^{\frac{\Delta v_I}{c}} = 1.1 \cdot e^{\frac{2.4}{2.0}} = 1.1 \cdot e^{1.20} = 3.65,$$

where the mass has to be thrown forward in the direction of the Earth's motion.

([Note] Such interferences may be obviated by radiating the mass $\frac{dm}{dt} = - am$ (see (1c)), directed against the disturbing planet and

Figure E.258: Walter Hohmann proposed and calculated what are now called Hohmann ellipses—elliptical orbits for transferring from one nearly circular orbit (such as that of a planet) to another (such as that of another planet) with the smallest possible expenditure of energy [Hohmann 1925].

Unter den unzählig vielen, überhaupt möglichen freien Umlaufbahnen um die Erde haben für unseren vorliegenden Zweck nur die wenigstens annähernd kreisförmig verlaufenden Bedeutung und hiervon wieder sind jene besonders interessant, deren Halbmesser (Abstand vom Erdmittelpunkt) 42 300 km beträgt (Abb. 54); denn diesem entspricht, bei einer zugeordneten Umlaufgeschwindigkeit von 3080 Meter je Sekunde, eine Umlauf-Winkelgeschwindigkeit, welche ebenso groß ist, wie jene der Erdrotation. D. h. aber nichts anderes, als daß ein Körper in einer dieser freien Umlaufbahnen die Erde ebenso schnell umkreist, als sie sich selber dreht: nämlich einmal in einem Tage („StationärerUmlauf“). Richten wir es nun außerdem noch so ein, daß die Umlaufbahn genau in der Äquatorebene liegt, dann würde der Körper dauernd über ein und demselben Äquatorpunkte stehen, und zwar in 35 900 km Höhe über der Erdoberfläche, wie sich nach Berücksichtigung des Erdhalbmessers von rund 6400 km ergibt (Abb. 54). Er würde dann gleichsam die Spitze eines ungeheuer hohen Turmes bilden, welcher selbst jedoch gar nicht vorhanden, dessen Tragkraft aber ersetzt wäre durch die Wirkung der Fliehkraft (Abb. 55).

Gladwin Hill, Nazis' Scientists Planned Sun 'Gun' 5,100 Miles Up. *New York Times.* 29 June 1945 p. 1.

PARIS, June 28—German scientists, a high United States Army ordnance officer disclosed today, were soberly working on a project of contriving a platform 5,100 miles in the air from which, within a matter of fifty or 100 years, it was believed, it might be possible to harness the sun's rays to demolish nations at will and rule the world.

"Fantastic" is the only word that comes to mind for this project. Yet "fantastic," officers here avow on the basis of the caliber of the scientists involved and the cold, sound method of their work, is a classification into which the project definitely cannot be put.

"We were interested," ordnance officers said after exhaustive interrogation of the scientists, "with their practical engineering minds and their distaste for the fantastic." They had even figured the dimensions of a mirror that would be necessary up 5,100 miles to focus the sun's rays for the purpose—three kilometers [1.86 miles] square.

These are some of the scientists who devised so recently the inconceivable buzz-bombs and the V-2 rocket bombs. They are some of the scientists who, it was disclosed today, had virtually perfected, in addition to the previously revealed secret weapons, a method of launching V-2 rocket bombs from submarines 300 feet under water that might have blasted New York as London was blasted.

They are scientists who, on the basis of their amazing rocket work, take it for granted that transatlantic mail rockets are a development of only a few years hence and that forty-minute transatlantic passenger rockets are probable in fifteen to twenty-five years.

It was disclosed further that a number of these scientists—there were about 100 leading rocket researchers and around 1,100 others—are so dedicated to their researches and so aware that there is no hope of pursuing them in Germany during their lifetime that they are putting science ahead of nationality and volunteering to move to the United States and Britain to continue their work. Plans are under official discussion for a center in the United States to exploit their discoveries.

How many of these discoveries have been disclosed to the Japanese is not known, but an intelligence officer at Supreme Allied Headquarters said last week that the Germans had withheld some secrets from them.

The man who made these astonishing revelations and the fullest report yet on German weapons at a press conference today is Lieut. Col. John A. Keck, chief of the Ordnance Service's enemy technical intelligence branch in the European theatre. Colonel Keck is a retired Pittsburgh engineer whose home is in Greensburg, Pa. A World War I veteran, he went to London in April, 1943, when his branch was organized to work with a similar British hush-hush bureau.

Spies Traced Germans' Work

Colonel Keck indicated that there was a regular traffic of Allied spies in and out of Germany, and said that through undercover activities the Allies had been able to keep virtually day-to-day information on the work at the Germans' main rocket-development base at Peenemuende on the Baltic, making possible the famous Royal Air Force bombing attack there during a conclave of scientists, which inflicted hundreds of casualties and is believed to have set rocket development back a fatal six months. [...]

The final contemplated objective was to launch projectile vehicles from the sky platform into interstellar space.

Despite the weird nature of these notions, the scientists were described by the Allied examiners as “men of extremely practical and keen minds,” Colonel Keck said.

Scientists Talkative on Ideas

One hundred and fifty rocket and other scientists were found by the Allied forces soon after the German surrender at a research center in Hillersleben, pondering their projects and waiting to discuss them. British officers have participated in the interrogations, which still are going on. The British War Office automatically receives copies of all American reports in this field, and Colonel Keck said the Russians had interrogated some of the same scientists and that it was intended to share German scientific information with “all the Allied nations.”

The submarine V-2 project was developed in Toplitz Lake, in the Austrian Alps, by Dr. Heinrich Determann and fourteen assistants, who were arrested by the Eightieth Infantry Division after a small boy and an old shoemaker in the lakeside village of Gossl had told the Americans of “big metal fish jumping from the water into the air” and of “undersea boats that shot out fiery comets.”

It transpired that the experimenters have started by shooting Nebelwerfer rocket field guns from a few feet under water and by last January had worked up to shooting from a depth of 300 feet a rocket that, once in the air, traveled like the V-2.

By the time the troops arrived the apparatus had been sunk in the lake and the records destroyed. Dr. Determann remarked: “Who knows? Perhaps German victory likes under Toplitz Lake.” It is hoped the work can be reconstructed.

New Anti-Aircraft Weapon

Another of the secret weapons that Colonel Keck said the Germans had “practically perfected” was a rocket-propelled missle capabe of exploding within ten yards of a plane ten miles in the air.

“It is generally conceded that the Allies urgently need a more effective anti-aircraft weapon, and it is expected that the rocket will replace all other types of anti-aircraft guns,” Colonel Keck said. “The German scientists’ contribution to the rocket field in the last decade was unique and a great engineering accomplishment.”

The speed attained by the V-2’s—which, it had been previously disclosed, the Germans were developing not only to fire across the Atlantic, but also as far as from Britain to Japan—would get them from Europe to the United States in less than an hour, Colonel Beck said, and, in the light of progress up to now, the question of slowing them down at the end of the trip to make them feasible for mail and passengers is a relatively “minor problem.” [...]

[This report describes detailed plans (and in some cases extensive development programs) for:

- Surface-to-air missiles that were "practically perfected" and had range and accuracy far better than anything possessed by the Allies.
- Submarine-launched ballistic missiles (note that much of the development and testing was being performed in the central European mountains, not just on the coast).
- Intercontinental rockets capable of crossing the Atlantic ocean (approximately 5000 km).
- Intercontinental rockets capable of traveling halfway around the Earth (approximately 20,000 km).
- A manned space station.
- Space-based solar energy collectors and directed energy weapons.
- Interplanetary (incorrectly stated as interstellar) space probes.

Versions of this story were also reported in:

To Rocket Mail over Atlantic in 40 Minutes. *Toronto Daily Star.* 29 June 1945 p. 1.]

George Millar. Hitler's Crazy Gang Were Not So Crazy. *Daily Express* 29 June 1945 p. 1.

PARIS, Thursday.—Hitler's scientists planned permanent stations 5,100 miles above the earth, to harness the sun's energy.

Allied experts have found this plan to be technically sound, it was stated in Paris tonight by Lieut.-Colonel John A. Keck, the senior U.S. soldier in the job of questioning German scientists.

The value of their work, Colonel Keck says, is staggering, so staggering that it is likely to revolutionise the course of our lives. It shivers the imagination.

And it sprang from the mad energy of Hitler, who demanded "scare and screw-ball weapons."

When the first silver clouds of Flying Fortresses filled the German sky, while the Allied world hailed these planes as the height of modernity, our experts knew that they were already obsolete.

The German "dream of space" began from the horror weapons which attacked London.

To the German scientists V2 was only a toy. They had worked out A10, which had a range of from 1,200 to 1,800 miles, compared with the V2's 162 miles.

And then they worked on an advanced version of A10, a giant rocket with wings.

Colonel Keck added: "If the war had gone on another six months we know that V weapons would probably have been pounding New York."

He went on to the second stage of the V experiments. At 5,100 miles above the earth's surface, where gravity is known to be neutral, the Germans planned to establish within from 50 to 100 years a "space station"—a kind of solid platform in the sky to house a colony of scientists, astronomers and observers.

Rule the world

There they would set up a large reflector or reflectors for concentrating the sun's rays on the earth for power-generating purposes.

The rays would be directed at specific spots on the earth's surface, where the heat energy of generated steam would be converted into electrical energy.

One German scientist said that the first country to install these reflectors in the heavens would be able to rule the world by focusing them to:–

> Turn the oceans to steam;
> Kindle forest fires;
> Wipe out whole cities.

Even more fantastic is the next objective—the forming on those platforms of "space stations" for launching space-ships which would travel, presumably, to other planets.

Colonel Keck added that all this material was at the disposal of the British Government, and that much of it had undoubtedly been handed by the Nazis to the Japanese.

The Russians had been given access to some of the German scientists questioned.

Volney D. Hurd. Nazi Trick Weapons 'Out Of This World.' *Christian Science Monitor* 29 June 1945 p. 1.

PARIS, June 29—Bombing of San Francisco by robot bombs launched in Japan cannot be considered entirely impossible, in the view of German physicists who stated that they would have been ready to shoot improved V-2's over a distance of 3,600 miles if they had been granted another six months' time for their research.

The step-by-step uncovering of German research work of the last five years has caused other surprises, too—none probably greater than the sensation provoked by the disclosure that German physicists gave serious thought even to fantastic plans for construction of a solar power station 5,100 miles above the earth's surface.

American ordnance experts are seriously interested in how far the Japanese have progressed in their rocket research. They find some German natural scientists very sound and think that an extension of the 3,600-mile range can be expected shortly.

Japan Given Data

Col. John A. Keck, chief of the Enemy Technical Intelligence branch, says he now can disclose this with the knowledge that the Japanese have full possession of German information.

Colonel Keck proved to the satisfaction of his office that German physicists would be so useful that plans are under consideration to bring a number of them to the United States and set up an exploitation center where United States armed forces and American industrialists may take advantage of their ability.

German rocket research followed two lines: Flight control and range. By 1938, a model had been developed which went 13 miles into the air and then came down with a parachute, allowing time to check the control instruments. From this grew the first V-2 used against London with a 150-mile range.

By the beginning of this year, the range was extended to 300 miles. A third model, the most recent, had a 1,200-to-1,800-mile range as a step to the 3,600-mile job scheduled to come up in November.

It is on this basis that Colonel Keck said he would very much like to know what Japan has done with the rocket information given it by the Germans.

According to Colonel Keck, the V-2, built on improved lines, weighs 13 tons, carries 2,150 pounds of TNT, and reaches a top speed of 3,600 miles an hour. This is achieved during the first third of the flight, at which time the fuel is exhausted. During the last two thirds of the flight, the bomb is carried by its own momentum through the stratosphere. It falls down to earth with a terminal velocity of 2,400 miles an hour.

There is no known defense against V-2's except to strike at the source from which they are launched.

Another phase of the German rocket research also promised plenty of trouble in the future. A group of researchists, headed by Dr. Heinrich Determann, explored the problems of underwater launching of rockets.

Colonel Keck pointed out that Hitler ordered all German artillery to be converted to rocket types by 1944. Actually the Germans have developed an antiaircraft or rocket flak gun able to range as high as 50,000 feet. Its explosion can be timed to within 10 feet of the objective, it was disclosed.

Other weapons of the rocket-launching variety were described as a 38-centimeter—about 15-inch—projector on a Tiger tank which could fire 760-pound shells and an 11-inch railway gun firing rocket-propelled missiles.

Flak Guns for U-Boats

By working on underwater launching, they developed flak guns for submarines. They had developed such a gun, so that their submarines in the future could have fired at low-flying airplanes without having to surface at all.

By January of this year, Dr. Determann had a rocket gun ready that could fire a rocket the size of a V-2 from 300 feet below the water surface at a predetermined point and angle of departure. It would burst out into the air in a typical V-2 flight.

This meant another answer to attacking the coast of the United States, for even with their short range of 300 miles, V-2's could be carried by submarines to a point 200 or 300 miles off the American coast. If fired from such a depth, chances of the German submarine being detected and caught would be very very slight. Unfortunately, Dr. Determann was able to destroy his blueprints, formulas, and other data and to sink the experimental machinery and equipment in the Toplitz See in Austria before American troops went there.

Technical Vistas Enlarged

Development of the rocket has opened vast vistas of technical marvels, long dreamed of by imaginative physicists all over the world.

One of these vistas, considered a "logical expectation within some 50 to 100 years," is the construction of a "space station," 5,100 miles up in the troposphere, with a 2-mile reflecting mirror capable of generating from the sun all the power needed in an area the size of Germany.

The space station is merely a theoretical projection, following the successful design of long-range load-carrying rockets with accurate controls.

So far, however, the Germans had not solved the problem of getting the "space stations" up there, or of controlling them when they arrived.

The conditions in the stratosphere and troposphere are well known enough to physicists so that factors to be met at great heights can be anticipated. The rocket's efficiency becomes the greater the higher it gets. It is on the basis of their recent achievements that German rocketeers look ahead and see the 5,100-mile altitude achieved in rocket travel within 50 to 100 years.

Of course it will be useful to remember that stories about exploitation of sun power have been a stock-in-trade of German pseudo- and popular-scientific literature. In most of the earlier instances, however, the scientifically valid idea of marshaling and transmitting sun energy by means of giant reflectors was coupled with the plan of building the power station in the Sahara desert.

Factor of Gravity

This 5,100 miles is a key number to the rocket engineers, because that is where the effect of gravity ends. [That idea is scientifically incorrect and does not appear in German reports. It is an American misunderstanding and seems to indicate that the general level of scientific understanding in the United States was quite backward compared to that in the German-speaking world at this time.] That means that all kinds of useful structures can be erected with minimum engineering problems because weight as such would no longer exist at such level. On the other hand, building without relying on the weight factor is bound to raise technical problems of a new kind.

Use of sun energy is a logical evolution of this "progressive" thinking. At this height, a large reflector concentrating the sun rays on a small area on the earth would offer tremendous potentialities. Sun rays massed and directed at a vast boiler area of some coastal country could generate enough steam to produce all the electric power the country could use, state the German natural scientists. And of course the warlike German thought must not be forgotten.

Concentrated sun energy could just as well be turned to destructive aims and used for the scorching and burning down of countries and the first state to develop the necessary devices would become all but invincible.

Moving back to the immediate future in rockets from Europe to America, there will be mail-carrying rockets first, and passenger-carrying rockets soon after, according to researchists. Like the advanced V-2, they would make the trip from Paris to New York in 40 minutes.

Nazis to Focus Rays of Sun for Slaughter. *Pittsburgh Post-Gazette* 29 June 1945 p. 63.

Paris, June 28—(UP)—German scientists at the end of the war were working on the idea of erecting stratospheric platforms 5,000 miles above the earth to be reached by rockets and used to launch attacks on targets on the earth's surface, it was revealed today by Lieutenant Colonel John A. Keck, chief of the work of salvaging enemy equipment.

The plan was known to 100 of Germany's foremost rocket experts, all of whom have been questioned by American and Russian army experts, he said. [...]

Another new German weapon, which was in the advanced stage, was a long-range transatlantic rocket called the A-10 which was designed to bomb the United States and which the scientists asserted would have been perfected in a few more months. [...]

A number of weapons were planned, Keck said. Among them were long-range rockets with a 3,000-mile radius, a 200-ton tank, a 5,000-pound multiple rocket with an anticipated 100-mile range, a transatlantic rocket which was to have been perfected this summer for the bombing of American cities, a "rocket assist" shell device designed to increase by 50 per cent the range of German artillery, and a "water to air" rocket fired from a submerged submarine which was to be used to bomb cities or as anti-aircraft against patrolling planes.

The Station in Space: Sun Power Stations Planned by Germans. *Journal of the American Rocket Society* September 1945, No. 63, pp. 8–9.

Disclosure of German war secrets found buried in mines and in the beds of rivers and lakes reveal that the Germans were contemplating the construction of solar space stations in the next 50 years. The stations, floating some 5,000 miles above the earth, were to function as an observatory, to possess a mirror, two miles in diameter, for focusing the sun's rays on earth steam-producing plants or for reflecting concentrated sunlight against hostile forces, and finally to act as a base for launching spaceships into outer regions.

The reported plans coincide so closely to proposals made on the subject in the late 20's and early 30's by Noordung, Pirquet, Oberth and others that apparently the Germans based their projects on these early theories. The terminal in space idea, which may at present appear visionary, generally takes the form of an elaborate rocket-powered plant of several sections circling the earth like a satellite at an altitude depending on its duties.

Noordung's Design

Captain Hermann Noordung, pen name of the Austrian Captain Potocnik, proposed a space station consisting of three separate units—living quarters, observatory and powerplant—connected by flexible air cables and pipelines to each other and moving in the same orbit. Placed some 22,300 miles above sea level the station was to revolve around the earth each 24 hours.

A large wheel-like structure about 100 feet in diameter, creating artificial gravity by rotating once every eight seconds, would house scientists and crew. This rotary house had rooms for every purpose located around the rim of the wheel and connected to the central airlock by elevators and stairs. All the necessities of life—light, heat, oxygen, water and food—were provided for, with energy from the sun supplying the power requirements of the station.

Captain Noordung intended that the cylindrical spatial observatory would observe weather conditions and other happenings on the earth's surface and report all observations in detail to ground stations. Due to the absence of air and dust and the lack of weight powerful telescopes of any size could be constructed and maintained. Study of the motions, distances, magnitudes and physical constitutions of the heavenly bodies would be undertaken by learned astronomers.

The sun power plant, consisting of a parabolic mirror and engine house, was to function in a manner similar to an ordinary steam turbine system. Liquid nitrogen vaporized by the sun's rays would drive a turbine coupled to an electric dynamo for providing direct current to the different buildings. The fluid on leaving the turbine would circulate to a dark-surfaced cooling unit and be pumped back for reuse.

The Triple Station

Count Guido von Pirquet, a co-founder of an Austrian rocket society, elaborating on the plans of Noordung suggested a three-unit arrangement consisting of an inner station for observations, an outer station for landing and refueling spaceships, and a transit station for contact purposes. The first two stations would travel in circular orbits around the earth while the transit stations circling in an elliptical orbit would approach within a mile of their orbits.

The approximate altitudes from the earth, length of orbits and time required for the stations to revolve around the earth are shown in the table. Speed of the transit station was to be three-quarters of a mile faster than the inner station as it neared the latter's orbit.

	Altitude above sea level (miles)	Length of orbits (miles)	Revolution around earth (minutes)
Inner Station	470	27000	100
Transit Station	470–3100	34000	150
Outer Station	3100	44600	200

Oberth Sun Mirror

Professor Hermann Oberth was much in favor of a station for observations which every four hours circled the earth at a height of 600 miles. He also conceived of a concave sun mirror constructed of small movable facets of metallic sodium mounted on a wire network in a circular frame. Sodium, a silver-white alkaline metallic element having high reflective properties, was considered most favorable for use in the non-corrosive airless regions of space. Adjustment of the facets by electro-magnets or other means would reflect the sun's rays over a large area or concentrate the heat energy into a single beam. Construction details were minutely worked out whereby free wires attached to a rotating spaceship could be made to spread out to form a huge network upon which strips of metallic sodium would be fastened.

Suggestions for shooting the sky station to its destination, towing or propelling it by rocket power were discarded in favor of the accepted idea of transporting the space plant piece by piece by rocket ship and assembling it in space. In the weightlessness of space workmen in space suits were conceded to have no difficulty in assembling heavy sections of the station.

The proposed sun mirror was to be employed beneficially or as a devastating force. Solar energy on being directed to ground turbine stations was to be utilized to generate steam for creating electrical power. Reflected heat would control weather, evaporate useless water and melt ice fields or illuminate large areas of the earth's surface at night.

Means for launching exploring spaceships to other planets and beyond into inter-stellar space was foreseen. Especially favorable was the suggestion of using the station as a refueling depot for spaceships ascending from the earth. The required fuel load from earth to space would be greatly reduced, as only enough fuel would need to be carried to overcome gravity from earth to the starting point for space travel.

History relates that in the siege of Syracuse, 212 B.C., Archimedes, Greek philosopher and inventor, set fire to the sails of the Roman ships by focusing the rays of the sun through newly invented burning glasses. As a weapon the Oberth reflector would also act much like a burning glass. Concentrated rays on earthly targets would turn bodies of water into steam while ships, cities and the implements of war would be burnt and destroyed.

No. 3839 — Evaluation of Germans Space Weapon Schemes

Figure E.263: Over two years after World War II ended in Europe, the U.S. War Department General Staff (WDGS) Intelligence Division wrote a report summarizing what they had learned about “German Space Weapon Schemes” that had been developed during the war. Even after so many decades, that report remains classified and unavailable to the public. Why? What information is in the report? [NARA RG 319, Entry NM3-82, Box 2899, Folder Project 3839]

E.5.2 Fission Thermal Rocket Propulsion

[Whereas most rockets employ chemical reactions, non-chemical (i.e., nuclear) rockets could deliver much higher performance for deep space missions. German-speaking scientists began the development of such advanced rocket propulsion systems during World War II and continued to lead their development after the war.

Fission thermal rockets store energy onboard in the form of a relatively conventional fission reactor, which is powered by suitable fuel such as uranium-233, uranium-235, or plutonium-239. Like chemical rockets, fission thermal rockets also store propellant onboard, yet unlike chemical rockets, fission thermal rockets do not require the propellant to undergo chemical reactions and release energy of its own. The propellant is simply heated by the reactor to achieve very high temperatures and pressures, then expelled out of the rocket nozzle, as shown in the upper part of Fig. 9.240. Minimizing the molecular weight of the expelled propellant maximizes the exhaust velocity, so most proposed fission thermal rockets use hydrogen propellant. The temperature to which the propellant is heated is limited by how hot the fission reactor can become without melting the fission fuel or other reactor components, but that still yields an exhaust velocity roughly twice that of the best chemical rocket engine.]

16 September 1942 memorandum of understanding between Peenemünde and the Reichspost [Peenemünde Archive, AHT0205].

Als zweite Forschungsarbeit auf größere Sicht wird seitens der Heeresanstalt Peenemünde-EW vorgeschlagen:	The second research project proposed by the Heeresanstalt Peenemünde-EW is a larger-scale research project:
“Untersuchung der Möglichkeit der Ausnutzung des Atomzerfalls und Kettenreaktion zum R-Antrieb”.	“Exploring the possibility of exploiting atomic decay and chain reaction for rocket propulsion.”
Die notwendigen Mittel für die Durchführung der Aufträge stellt das Reichspostministerium selbst zur Verfügung.	The Reichspost Ministry itself will provide the necessary funds to carry out the commission.

[This document proves that scientists at Peenemünde and the Reichspost began programs on nuclear rocket propulsion no later than 1942. See Figs. E.264–E.265.]

Treibstofforschung

Vorg.: Besprechung am 15.9.42 in Peenemünde
Betr.: Übernahme von Forschungsarbeiten auf dem Gebiet der Rückstoßgerät
Auftrag-Nr. SS 023-4980/III/42

Unter Bezugnahme auf die Besprechung von Oberpostrat Gerwig, Dr.Himpan und Dr.Ing.Thiel, HAP/EW, erteilt die Heeresanstalt Peenemünde als Entwicklungsstelle des Oberkommandos des Heeres, Abteilung Wa Prüf 11, der Forschungsanstalt der Deutschen Reichspost folgenden Forschungsauftrag auf dem Gebiet des Flüssigkeits-R-Antriebes:

"Untersuchungen über die Leistungssteigerung von Flüssigkeits-R-Antrieben durch Verwendung von Treibstoffgemischen höchsten Energiegehaltes".

Besprochen wurden Untersuchungen folgender Verfahren:

Kombinationen Salpetersäure mit Kraftstoff + Metall oder Kohlenstaubzusätze.

Anstelle von Salpetersäure kann auch bei entsprechenden Liefermöglichkeiten der zuständigen Industrie Tetranitromethan gewählt werden.

Als Kraftstoffe kommen in Frage:

Benzol, Benzin, Kraftstoffe auf Acetylenbasis.

Als Zusätze kommen in Frage:

Kohlenstaub, Aluminium, Magnesium, Eisen, Beryllium u.weitere.

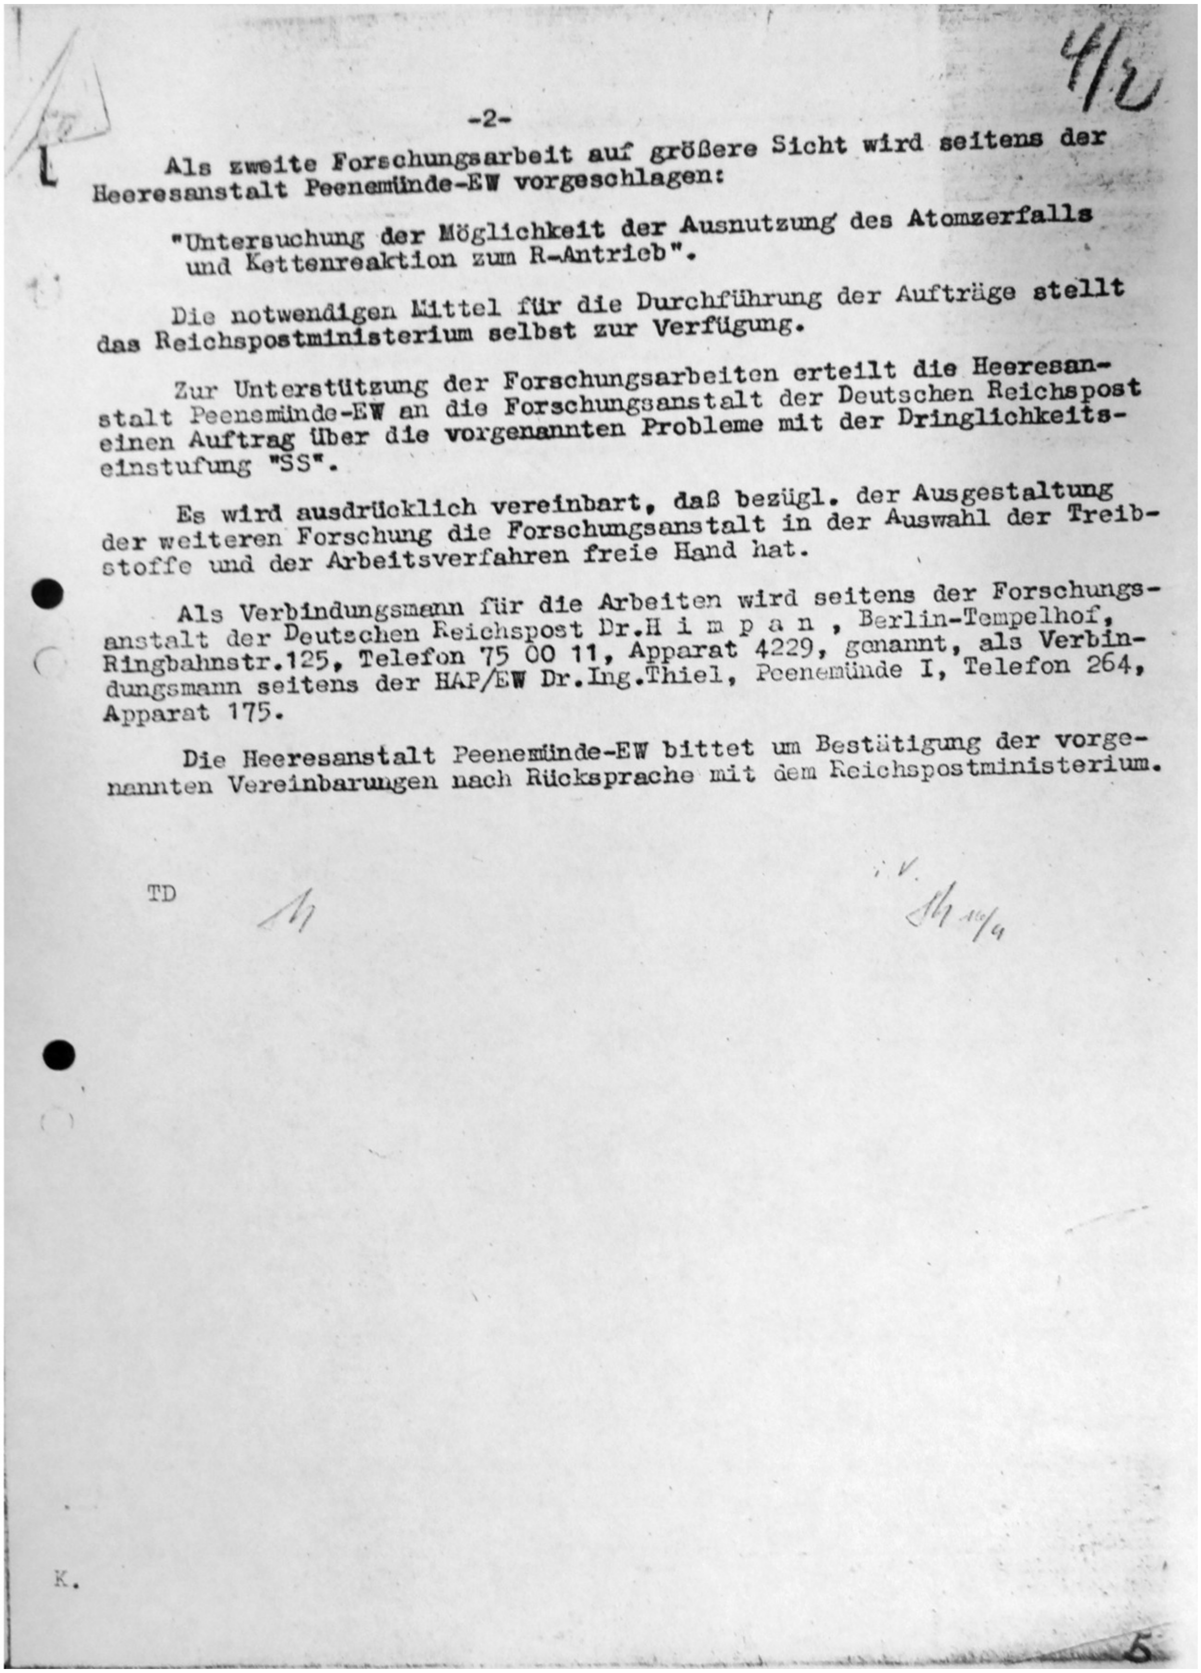
Der Forschungsauftrag umfaßt theoretische, laboratoriumsmäßige und experimentelle Klärung des gesamten Einspritz-, Gemischbildungs- und Verbrennungsproblems.

Die Untersuchungen sind auszudehnen auf:

Grundsätzliche Untersuchungen über Herstellungsmöglichkeit von Metallsolen in Kraftstoffen,
Untersuchungen über Beständigkeit,
" " physikalische Eigenschaften,
" " Durchflußbeiwerte und Einspritzvorgänge,
" " Verbrennungsvorgänge.

Die Heeresanstalt Peenemünde EW sagt Unterstützung dieser Arbeiten durch Zurverfügungstellung der bisher bekannten Literatur-arbeiten und der Erfahrungen auf dem Gebiet der Triebwerksentwicklung zu. Mit Herrn Oberpostrat Gerwig wird vereinbart, daß die Ergebnisse der bei der Forschungsanstalt der Deutschen Reichspost durchgeführten Untersuchungen der HAP-EW laufend zur Verfügung gestellt werden.

Figure E.264: Scientists at Peenemünde and the Reichspost began programs on nuclear rocket propulsion no later than 1942 [Peenemünde Archive, AHT0205].



4/2

-2-

Als zweite Forschungsarbeit auf größere Sicht wird seitens der Heeresanstalt Peenemünde-EW vorgeschlagen:

"Untersuchung der Möglichkeit der Ausnutzung des Atomzerfalls und Kettenreaktion zum R-Antrieb".

Die notwendigen Mittel für die Durchführung der Aufträge stellt das Reichspostministerium selbst zur Verfügung.

Zur Unterstützung der Forschungsarbeiten erteilt die Heeresanstalt Peenemünde-EW an die Forschungsanstalt der Deutschen Reichspost einen Auftrag über die vorgenannten Probleme mit der Dringlichkeitseinstufung "SS".

Es wird ausdrücklich vereinbart, daß bezügl. der Ausgestaltung der weiteren Forschung die Forschungsanstalt in der Auswahl der Treibstoffe und der Arbeitsverfahren freie Hand hat.

Als Verbindungsmann für die Arbeiten wird seitens der Forschungsanstalt der Deutschen Reichspost Dr.Himpan, Berlin-Tempelhof, Ringbahnstr.125, Telefon 75 00 11, Apparat 4229, genannt, als Verbindungsmann seitens der HAP/EW Dr.Ing.Thiel, Peenemünde I, Telefon 264, Apparat 175.

Die Heeresanstalt Peenemünde-EW bittet um Bestätigung der vorgenannten Vereinbarungen nach Rücksprache mit dem Reichspostministerium.

Figure E.265: Scientists at Peenemünde and the Reichspost began programs on nuclear rocket propulsion no later than 1942 [Peenemünde Archive, AHT0205].

Charles A. Masson, Headquarters United States Air Forces in Europe, Assistant Chief of Staff, A-2, to Assistant Chief of Staff, T-2, Headquarters Air Technical Service Command, Wright Field, Ohio. 1 February 1946. Transmittal of German Documents. [AFHRA C5098 frame 0393]

1. Forwarded herewith for evaluation are documents received from three German scientists:

[...] c. KRAFFT EHRICKE (or Müller)—"Discussion of Activity on Rocket Problems." This man apparently has a very extensive background in rocket propulsion. However, his assertions can probably be checked with the German scientists now at Wright Field.

2. It is requested that this headquarters be notified as soon as possible as to the decisions made with regard to these documents and their submitters, [...]

3 Incl: [...]
3. Krafft Ehricke (or Müller)—"Discussion of Activity on Rocket Problems."

H. M. McCoy, Acting Deputy Commanding General Intelligence (T-2), H.Q., AMC, Wright Field, Dayton, Ohio to U.S. Air Forces in Europe, Assistant Chief of Staff, A-2. 14 August 1946. Transmittal of German Documents. [AFHRA C5098 frame 0392]

1. Inclosures 2 and 3 to basic communication are returned with the request that, if possible, additional information be furnished this office on the following subjects:

[...] b. Metals in fuels and designs of atomic rockets and secret reports of Professor Heisenberg referred to in paragraph 2, page 4, inclosure 3.

c. Burning metals or use of uranium 235 for rocket propulsion referred to in paragraph 2, page 3, inclosure 3.

d. Experience on tetranitromethane referred to in paragraph 2, page 6, inclosure 3.

2. If additional data are available on the above subjects, it is requested such data as can be obtained be forwarded to this office for transmittal to the proper laboratory. [...]

2 Incls: [...]
3. Krafft Ehricke (or Müller)—"Discussion of Activity on Rocket Problems."

[Where are the enclosures and secret reports referenced in these two documents? Note that these two documents appear to be directly related to the document shown in Figs. E.264–E.265—in addition to nuclear propulsion there are mentions of tetranitromethane and burning metals.

Why was Krafft Ehricke apparently going by the pseudonym of "Müller"?

Exactly what work did Krafft Ehricke, Werner Heisenberg, and others scientists do on atomic rockets during the war? The United States seems to have interrogated them and also acquired many of their written reports. Where are those interrogation reports and scientific reports now?

How much effect did German-speaking scientists and their information have on postwar programs on atomic rockets in the United States and other countries?]

BIOS 142. *Information Obtained from Targets of Opportunity in the Sonthofen Area.* 1945. p. 8.

(e) High speed fighter aircraft

Ernst said that while he was in Camp Mecklenburg, he found out that there were three new types of high speed fighter aircraft. One of these was the P 1073, made by Messerschmitt with a B.M.W. 003 engine using petrol as fuel; and the second was a similar aircraft using crude oil as a fuel. The third was alleged to be powered with an atomic engine. The fuselage, which was the same as the P 1073, was of wooden construction and was fitted with skid landing gear. The engine was 60 cms. long and 20 cms. in diameter, and produced about 2,000 h.p. This aircraft was supposed to have a speed of 2,000 km./hr. and a ceiling of 18,000 m. The engines were made by the prisoners at Camp Mecklenburg. Only one model was ever in existence, and that was completely destroyed, as was the whole camp, by the S.S. during the Allied advance.

(f) Other work at Camp Mecklenburg

Ernst also stated that work was carried out at this camp on a new liquid air bomb, and liquid air gun (?), while trials on some kind of atomic bomb were made at or near the camp.

[During this postwar interrogation by British investigators, Josef Ernst described several now well-known wartime projects, as well as a mysterious wartime project to construct a supersonic fission-powered aircraft. He also mentioned other nuclear work at the same facility. There were several independent reports of nuclear-related work at that facility, which adds to the credibility of Ernst's story. For more information on the facility, see p. 4180.

See p. 4532 for a similar account of the wartime production of a nuclear-related supersonic jet aircraft by Horst Kirfes, an engineer captured by the Soviet Union after the war.

Was the nuclear device mentioned by Josef Ernst fission fuel for a nuclear-powered jet engine, or could it have been a nuclear weapon that would have been delivered by that aircraft?]

Robert E. Work. 17 April 1946. Preliminary Interrogation Report. Franz Focke. [AFHRA A5183 frames 0091–0092; see also frames 0108–0109]

Focke has been interested in atomic energy for many years. He claims to have worked out theories which involve the use of atomic energy as source power for aircraft engines. Focke is convinced that the unlocking of the energy of atomic kernels [nuclei] for industrial and transportation purposes can be effected. As a result of his extensive research work he applied for and/or obtained the following patents from the German Patent Office. [...]

This office plans to interrogate him regarding his ideas of the utilization of atomic energy in aircraft. [...]

[Can the patents, more detailed interrogation reports, and other information on Franz Focke's work on nuclear aircraft propulsion be located?]

Edmund Tilley. Brief Interrogation Report on Prof. Dr. Wernher von Braun. With additional statements on PROJECT ABSTRACT. FIAT, T-Force, SPEC-A 477/3. 8 July 1947. [TNA FO 1031/128]

1. On 8 March 1947 Dr. von BRAUN was brought to H.Q. USFET for an interrogation by Dr. John H. MARCHANT of BROWN University and by the undersigned. The interrogators were told of von BRAUN's status in the United States where many senior officers, especially in Army Ordnance, hold him in high esteem and consider him invaluable in his work. The interrogation was, therefore, conducted very informally and on cordial terms.

2. Indirectly intelligence had reached interested agencies in the United States that von BRAUN was aware of the existence of caches of PEENEMÜNDE documents and also instruments and that he had not yet revealed these caches to his employers in the United States. It was rumoured that he might use this knowledge as a bargaining point in any future negotiations in the United States. Furthermore, there was the feeling in some circles that he was not reproducing freely all the latest phases of German development in guided missiles, in particular in V-2. [...]

4. Recently Lt. Gen. DORNBERGER stated that von BRAUN and (Lt. Col.) AXTER were both present when he hid a tin, containing the location maps or sketches of hiding places, at OBERJOCH, in May 1945. He repeated this statement several times at OBERJOCH, during a search for the tin, in May 1947. When he discovered that the tin had been removed he recalled that von BRAUN had shown him some location maps in May 1945, a few days after they had surrendered to the American forces. [...]

70. Atomic Energy as Propellant for V-2. The second question about the possibility of using atomic charges in the warhead of V-2 was firmly rejected. "I had nothing to do with atomic energy". In the end he admitted that atomic energy had been considered by him in 1943.

71. "Two years before 1945" (i.e. in 1943) he had had "a private and not very definite contact with the KAISER WILHELM INSTITUT in DAHLEM" (now in the American Sector of BERLIN). In 1943 he talked to Professor Werner HEISENBERG and his fellow-workers, DR. WEIZAECKER, and Manfred von ARDENNE. In 1943 HEISENBERG was preparing a uranium pile with heavy water which had been produced in NORWAY. This work was financed by the German Navy which hoped to have submarine engines driven by atomic piles. The project was abandoned "because the atomic research people lacked the necessary quantities of raw materials". +) and Dr. RAMM

72. Once more he denied that there had been any discussion of atomic, BW or CW charges at BAD SACHSA; he had not even heard rumors of such charges for guided missiles. He stated that he had shown an interest in atomic energy in 1943 only to determine if it could be used for V-2 as well as for submarines, i. e. as a propellant, but not as a charge for the warhead.

73. He has not discussed this subject with anyone in the UNITED STATES. "Nobody has ever asked me about this".

74. GROETTROP and "PROPELLANT GREEN".

List of German V-2 Experts in Russia. Von BRAUN mentioned casually that a few days before this interrogation a German expert who is now working for the Russians had visited him at LANDSHUT and had given him a list of all important Germans employed by the Russians in the field of guided missiles. Von BRAUN promised to send two copies of this list, through secure channels, to G-2 USFET. (From the UNITED STATES he was also going to forward a list of all projects at BAD SACHSA in 1945).

75. GROETTROP: According to other sources GROETTROP is the most important German V-2 expert with the Russians. Von BRAUN said of him: "He is a dangerous man. He copies all sorts of things that are not in his field."

84. Von BRAUN has made several mistakes. He did not inform American experts in the UNITED STATES of some important projects and activities in the field of guided missiles, such as the contemplated use of the ROECHLING Projectile (paras 64–69), the project to use atomic energy as a propellant (paras 70–73) and the various projects, whether good or bad, at BAD SACHSA. Above all, as late as March 1947 he failed to tell the truth about important caches of documents. As far as OBERJOCH or UPPER BAVARIA is concerned the evidence forces us to declare him deliberately untruthful [...]

88. (Note: While these notes were being written S/Ldr. KENNY informed the undersigned that von BRAUN had spoken of atomic energy at GARMISCH, in 1945. It is odd that, in March 1947, he should deny any previous discussion of this important point (Par. 73.)

[For information on Edmund Tilley, see pp. 4894–4895. For more information on Project Abstract, see Mills and Johanson 2019.

In point 88 above, Squadron Leader E. J. André Kenny (one of the most important British aerial photo interpreters for Operation Crossbow [David Irving 1965, see index; McGovern 1964, pp. 13, 268]) said that Wernher von Braun had discussed nuclear-armed rockets at Garmisch in 1945, in contrast to what von Braun was admitting to Tilley in 1947. Kenny had visited Garmisch and other German sites in early May 1945 as part of CIOS Team 183 [O'Mara 1945, pp. 544–547].

This information from Kenny was independently confirmed by British journalist Gordon Young, who interviewed von Braun and Walter Dornberger at Garmisch in June 1945. They told Young that the V-2 would have soon received a "much more powerful" warhead. Allied censorship forced Young to eliminate any reference to German nuclear weapons at that time, since the U.S. nuclear weapons program was still completely secret. In August 1945, after U.S. nuclear weapons were used on Japan and became publicly known, Young tried to publish a second article reporting what he had learned from von Braun about nuclear-armed rockets. That second article was censored completely; only a brief reference in another article in Young's own newspaper (*Daily Express*) and three short articles in Australian newspapers escaped that second and final censorship (pp. 4679–4681).

See also the testimony given by former Nordhausen forced laborer Alex Baum (p. 5335). Baum remembered that von Braun eagerly expected the arrival of a new rocket warhead with tremendous destructive power.

For further evidence of rockets with nuclear warheads, see the summary of the interrogation of engineer Horst Kirfes (p. 4532), as well as the July 1946 *AAF Review* (p. 5038).

For many more references to nuclear-armed rockets that were intended to attack Allied targets during the war, see the list of documents on p. 5821.]

Howard R. Schmidt. 14 November 1962. History of the Nuclear Rocket: Pre-NERVA Development. American Rocket Society conference paper.

[I need to find a copy of this. Pages 2–3 mention wartime German research on nuclear rocket propulsion.]

John Sloop. 1978. *Liquid Hydrogen as a Propulsion Fuel, 1945-1959.* NASA SP-4404. Washington, D.C.: U.S. Government Printing Office. pp. 191–192. [https://www.hq.nasa.gov/pao/History/SP-4404/ch10-3.htm]

The first rocket stage to fly using liquid hydrogen and liquid oxygen as propellants was the Centaur stage on top of an Atlas intercontinental ballistic missile. Centaur was the brainchild of Krafft Ehricke. For nearly three decades, Ehricke had prepared himself for the space age; when it dawned with Sputnik, he was ready. Within a month, he proposed a hydrogen-oxygen stage for use with the Atlas missile. Ehricke was able to move rapidly because previous work on the Atlas missile and the ideas of others about hydrogen-oxygen upper stages had laid the groundwork.

Ehricke became a space enthusiast at the age of eleven when he was captivated by Fritz Lang's "Girl in the Moon," shown in Berlin in 1928. Advanced in mathematics and physics for his age, he appreciated the great technical detail that Hermann Oberth had provided to make the film realistic. Young Krafft became acquainted with Tsiolkovskiy's space rocket using hydrogen-oxygen, which he read about in Scherschevsky's *Die Rakete fuer Fahrt und Flug*. He also tackled Oberth's *Wege zur Raumschifffahrt* in his early teens, but was slowed by the mathematics. Ehricke graduated from the Technical University in Berlin (aeronautical engineering) and took postgraduate courses at the Humboldt University in celestial mechanics and nuclear physics. He was conscripted into the army, served in a Panzer division on the Russian front during World War II, but was recalled and reassigned to rocket development work at Peenemunde in June 1942. There he came under the strong influence of Walter Thiel, in charge of rocket engine development, who was killed in the first British air raid on Peenemunde in October 1943. Peenemunde, under Maj. Gen. Walter Dornberger and Wernher von Braun, his technical director, had a single purpose—the rapid development of specific weapons—and there was no official tolerance of work not directly related to the main goal. In spite of this, Thiel shared Ehricke's desire to look beyond the immediate future to greater possibilities. Thiel himself drew plans for testing rockets larger than any yet dreamed of—on the order of 5–14 meganewtons (1–3 million lb thrust). He wanted to use natural gorges in Bavaria as testing sites. He talked to Ehricke about resuming his own earlier experiments with liquid hydrogen in small rocket thrust chambers. The experiments of Heisenberg and Pohl with a nuclear reactor using heavy water excited Thiel. When he heard that Heisenberg was planning to operate a turbine with steam heated by the heavy water reactor, Thiel urged Ehricke to study the possibilities of using nuclear energy for propulsion. Ehricke considered several working fluids, but both he and Thiel favored hydrogen and believed it was a fuel with a future.[11]

As the war was ending, Ehricke helped move Peenemunde records into Bavaria, to keep them out of Russian hands. He made his way on foot to Berlin where he found his wife and went into hiding until the Western Allies moved in. He was located by the U.S. Army, given a six-month contract, and came to the United States to rejoin the von Braun team as part of the Paperclip operation.*

Ehricke and von Braun recalled another time they had considered hydrogen. In 1947, von Braun asked Ehricke to check a report by Richard B. Canright of the Jet Propulsion Laboratory on the relative importance of exhaust velocity and propellant density for rockets of the V-2 size and larger (pp. 47–48). It had caught von Braun's attention because he and two associates had written a paper the previous year which Canright had cited.[12] Von Braun had found, under the assumptions of fixed tank volume and a relatively heavy structural mass, that propellants with the highest densities and reasonably high exhaust velocities had the greater ranges. Canright, on the other hand, found that for large rockets and his assumptions (which included a variable tank volume and relatively light structural mass), exhaust velocity was decidedly more important than density. Canright's analysis showed hydrogen to be superior to other fuels when using the same oxidizer. Both Ehricke and von Braun, familiar with Oberth's case for using hydrogen-oxygen in upper stages of rockets (appendix A-2), agreed that hydrogen had a good potential for certain applications. Practical experience with liquid hydrogen in rockets at that time, however, was still very small and its handling problems large. The Army, for whom von Braun and Ehricke worked, wanted practical propellants that could be stored and handled safely in the field. This convinced von Braun to stick to well tested and denser propellants, but Ehricke felt less restrained and hydrogen's potential remained prominent in his thinking.

---

[11] Interview with Krafft Ehricke, Rockwell International, El Segundo, CA. 26 Apr. 1974.

* Ehricke wanted to work for the Americans, and he hid each time someone knocked on his door, waiting for the right caller. One day his wife answered the door and routinely said, “I don't know where he is.” As she did so, she recognized the insignia of a U. S. Army officer and immediately began screaming, “He's here! He's here!” Interview, 26 Apr. 1974. Paperclip was the project for bringing German rocket experts to the United States.

[Who was Pohl and what else did he do? Is that Robert Pohl from Göttingen or another Pohl?]

Charles A. Lindbergh. 1970. *The Wartime Journals of Charles A. Lindbergh.* New York: Harcourt Brace Jovanovich. pp. 970–971.

From the Wörthsee we drove to Allach to look for Dr. Neugebauer,[13] head of the Munich research center near Hohenbrunn, which never reached completion. Baeumker said he was one of the best men in Germany to give a comparison of the development and uses of their various types of engines. We found him living with his family in a small frame house not far from the Allach railroad station. He had one more week's work to close the research institute, he said. Then, since he had eleven people to support, including five children, he would apply for work in a locomotive factory.

Neugebauer is primarily interested in the development of a diesel turbine to be connected to a free-piston reciprocating engine, for use in long-range aircraft cruising at speeds of 500 to 550 kilometers per hour. This type of engine would be for the immediate future, Neugebauer thinks. The turbine engine will come later when we learn how to use higher temperatures. The sequence of engines used in aviation in the future will be 1) diesel; 2) turbine with propeller; 3) turbojet, according to Neugebauer. He thinks the Lorin jet [ramjet] will be used for speeds above 1,000 kilometers per hour. He says that a single-cylinder engine for his diesel development was almost finished.

I gave Dr. Neugebauer the rest of the candy I had with me for his children, and we started back to our billets.

[13] Dr. Franz Josef Neugebauer, engineer specializing in thermal systems for aircraft nuclear propulsion. He had been chief of initial development at the Junkers factory at Dessau, 1924–38; technical and plant manager at the Junkers factory in Munich, 1938–43; manager at the Luftfahrtforschungsanstalt in Munich, 1943–45. In 1945 he came to the U.S. and was a consulting engineer at headquarters, Air Materiel Command, Wright Field.

[Neugebauer apparently worked on both nuclear and non-nuclear aircraft propulsion during the war. Lindbergh, in collaboration with his editors, mentioned the nuclear work in a footnote. Lindbergh's personal discussions with Neugebauer seem to have focused on the non-nuclear work for one or more reasons:

1. Lindbergh's own career, knowledge, and interests were centered on long-range non-nuclear aircraft propulsion.
2. Maximizing the range of non-nuclear aircraft engines was a high priority in Germany by the end of the war.
3. Neugebauer did not want to discuss details of classified nuclear work with Lindbergh.
4. Lindbergh deliberately avoided writing down details about classified nuclear work.
5. Any nuclear details that Lindbergh did write down were censored before publication.]

Joyce Milton. 1993. *Loss of Eden: A Biography of Charles and Anne Morrow Lindbergh.* New York: HarperCollins. pp. 415–416.

Charles worked for United Aircraft in Connecticut until May of 1945, and shortly after V-E day, he joined a Naval Technical Mission in Europe as a civilian representative of the corporation. [...]

Joining the Technical Mission in Munich, Lindbergh became part of a team of observers who drove their jeeps into territory where the Wehrmacht, defeated but not yet demobilized, was still in effective control. [...] Lindbergh's group located Professor Willy Messerschmitt, who was living in a barn; Dr. Felix Kracht, the inventor of the rocket glider; Dr. Helmut Schelp, assistant head of development of the jet and rocket propulsion program; Dr. Franz Josef Neugebauer, who was working on a design for a nuclear-propelled aircraft; Dr. August Lichte, a developer of the Junker JU 004 turbojet engine; and Dr. Ulrich Henschke, who was working on artificial limbs capable of being controlled by neurological impulses.

Tom Agoston. 1985. *Blunder! How the U.S. Gave Away Nazi Supersecrets to Russia.* New York: Dodd, Mead. pp. 12-13.

By quirk of fate, the careers of Kammler and Voss overlapped at Skoda, where they jointly set up and operated what was generally regarded by insiders as the Reich's most advanced high-technology military research center. Working as a totally independent undercover operation for the SS, the center was under the special auspices of Hitler and Himmler. [...] In so doing the SS group was to go beyond the first generation of secret weapons.

Its purpose was to pave the way for building nuclear-powered aircraft, working on the application of nuclear energy for propelling missiles and aircraft; laser beams, then still referred to as "death rays"; a variety of homing rockets, and to seek other potential areas for high-technology breakthrough. In modern high-tech jargon, the operation would probably be referred to as an "SS research think tank." Some work on second-generation secret weapons, including the application of nuclear propulsion for aircraft and missiles, was already well advanced.

It was far from a mad Nazi scientist's dream of getting to the end of the nuclear rainbow. The field had been pioneered by Dr. Wernher von Braun, designer of the V-2, in the early 1930s. In addition, it was recently disclosed that one of the first top German engineers cleared for urgent work for the U.S. Air Force in 1945 was Dr. Franz Josef Neugebauer, a specialist in thermal systems for aircraft nuclear propulsion. In 1958 the United States launched Project Orion to probe the applicability of nuclear propulsion for aircraft, employing some Czech scientists. The project was continued until 1965 and then was turned over to the U.S. Air Force, plans for its application for the civilian space programs having been dropped.

The SS research operation at Skoda had been set up without the knowledge of Goering, Speer, or the German research centers. The builders of the V-1 and V-2 were likewise kept out of the picture. The undercover SS research operation fitted in with Himmler's dream that, as the Rheingold of the Nibelung's, if shaped into a ring, would give its possessor mastery of the world, so would the SS team give the Greater Reich mastery of much of the world.

A study of intelligence reports shows that blueprints, drawings, calculations, and other relevant documentation or materials were protected by a triple ring of SS counter-intelligence specialists Himmler had assigned to Pilsen to prevent security leaks and sabotage in the research divisions and the plant in general. The SS team was internally referred to as the Kammler Group. Taking a leaf from the armament ministry name for the special section Kammler headed there to iron out aircraft production bottlenecks, they were called the Kammler stab or Kammler "staff."

[This book by British journalist Tom Agoston was based on extensive postwar interviews with Wilhelm Voss, wartime manager of the Skoda works in German-occupied Czechoslovakia.]

[Franz Josef Neugebauer's 1946 U.S. Army Air Forces report, *Project No. NFE-64: Effect of Power-Plant Weight on Economy of Flight*, appears to be a translation of one of his wartime German reports [Neugebauer 1946]. Although the type of power plant is not specified in this particular report, weight would be one of the most important factors in nuclear versus more conventional propulsion systems. There may have been a classified, unreleased, longer version of the report that included details about the nuclear aspects of the project.

Neugebauer apparently continued his work on nuclear aircraft propulsion in the United States for many years. In 1962, working with both General Electric and the Office of Naval Research, he released an unclassified reference book on hot gases that was probably just one small part of his work on nuclear propulsion [Neugebauer 1962].

Would it be possible to locate and declassify uncensored versions of those or other reports by Neugebauer that do explicitly refer to nuclear propulsion?]

Heinrich Himmler's chief adjutant Werner Grothmann on nuclear rocket propulsion [Krotzky 2002]. For a discussion of the background and reliability of this source, see pp. 3396–3397.

[S. 47] Spätestens als wir in Peenemünde den Finger in die Tür bekamen, ist überlegt worden, ob es nicht möglich wäre, die Atombombe mit einer Rakete zu verschießen. Das war ja erst mal reine Theorie. weil wir doch Vorstellungen von dem Ding hatten, die sich nicht umsetzen ließen. Die Untersuchungen dazu sind aber weiter gelaufen. In Peenemünde selbst ist an der Frage, so weit ich weiß nicht mit großer Begeisterung geforscht worden, obwohl die ja eigene Atomlabors hatten. Ich war ja schließlich selbst drin. Für die war aber eher die Frage wichtig, ob eine Rakete mit Atomantrieb fliegen kann. Warum die daran geforscht haben, hatten Himmler und ich bei unserem ersten gemeinsamen Besuch auch gehört. Die Techniker hatten uns berichtet, dass der Antrieb schon wunderbar funktioniert, das konnte man dann später ja auch sehen. Es war aber so, dass der gesamte Treibstoff in kürzester Zeit verbraucht war und damit konnte man nur über eine kurze Entfernung schießen. Kurz ist eigentlich nicht richtig. Damals waren wir schon begeistert von der Entfernung, die man mit der Rakete hinbekommt. Wenn man jetzt aber weiß ,dass in dem Uran viel mehr Energie steckt als im gleichen Gewicht von dem Treibstoff, den die verwendet haben, also das war Sauerstoff und noch was, dann müsste es doch möglich sein, über weitere Strecken zu fliegen. So ist uns das erklärt worden. Man hat uns aber auch gesagt, die Forschung dazu steckt in den Kinderschuhen, das ist noch ein weiter Weg. Himmler hat dann gesagt, er begrüßt diese Forschung, wichtiger ist aber erst mal, dass man die Rakete so hinbekkommt, dass die überhaupt zuverlässig funktioniert, und das muß schnell gehen.

[p. 47] At last when we [SS] got a finger in the door in Peenemünde, it was considered whether it would be possible to launch the atomic bomb with a rocket. That was pure theory for the time being, because we had ideas about the thing that could not be implemented. However, the investigations continued. In Peenemünde itself, the question, as far as I know, had not been investigated with great enthusiasm, even though they had their own atomic laboratories. I was finally there myself. For them, however, the more important question was whether a rocket can fly with nuclear propulsion. On our first joint visit, Himmler and I heard why they researched that topic. The technicians told us that the propulsion already works wonderfully, we could also see that later. But it was true that all the propellant was consumed within a very short time, and so it could fly only over a short range. Short is actually not right. At that time, we were already excited by the range that the rocket gave. But if you now know that there is much more energy in the uranium than in the same mass of the fuel that they used, which was oxygen and something else, then it should be possible to fly over greater distances. That is how it was explained to us. But we were also told, the research is in its infancy, with still a long way to go. Himmler then said he welcomed this research, but it is more important that the rocket is perfected so that it works reliably, and that must be done quickly.

[Grothmann stated that the rocket research center at Peenemünde had its “own atomic laboratories” and was using those to develop nuclear rocket engines. How far did research on nuclear rocket engines get during the war? Did that work cover fission thermal engines, ion engines, external pulse propulsion, or other methods? How much did that wartime German research influence postwar work on nuclear rocket engines in the United States and other countries?]

E.5.3 Fission Pulse Rocket Propulsion

[In contrast to fission thermal propulsion, fission pulse propulsion employs fission reactions that occur outside of the rocket, and therefore are not constrained by the melting temperatures of the fission fuel or any rocket components. Thus the fission reactions can reach the highest possible temperatures—those of a fission explosion. Small fission bombs could be ejected from the rear of the spacecraft; they would explode near the spacecraft, and some fraction of the blast would be intercepted by a thick ablative "pusher plate," transferring momentum while protecting the rest of the spacecraft (Fig. 9.240 bottom). To smooth out the violent shocks of intermittent explosions into more continuous and more survivable acceleration for the spacecraft, the pusher plate would be connected to the rest of the spacecraft by giant compressible shock absorbers. The heat, radiation, and shock to which the vehicle would be subjected pose formidable constraints on the materials and engineering design, yet the prospect of achieving both very high exhaust velocities and high thrust-to-weight ratios with an available energy source (fission explosives) is attractive.

Most books on the subject say that nuclear pulse propulsion was first proposed after World War II by Stanislaw Ulam (Polish, 1909–1984), who was a creator from the greater German-speaking world [e.g., Dyson 2002, p. 2]. In fact, this approach was first proposed and explored by even earlier German-speaking creators.

External pulse propulsion by conventional chemical explosives was first proposed by Hermann Ganswindt (German, 1856–1934) [Ron Miller 1993, pp. 75–76; Ron Miller 2016, p. 48].

The following sources show that external pulse propulsion by nuclear explosives was first proposed in approximately 1942 by Wernher von Braun. Considering the German military's great wartime interest in and funding for rockets, nuclear weapons, and revolutionary methods of delivering heavy payloads long distances, it seems likely that fission pulse propulsion was seriously considered during the war, although little relevant documentation is currently available. By the end of the war, work in this area had apparently progressed at least as far as creating small test models powered by conventional chemical explosives, which is as far as the work ever progressed in the United States after the war before the U.S. program was cancelled.

Archives and personal collections worldwide should be searched for more information about nuclear pulse propulsion work that was conducted during the war.]

Friedwardt Winterberg. 2010. *The Release of Thermonuclear Energy by Inertial Confinement: Ways Towards Ignition.* Singapore: World Scientific. pp. v, vii.

Dedicated to [...]

Wernher von Braun
who first thought about nuclear rocket propulsion [...]

Having been born in Germany in 1929, I received my PhD in physics under Heisenberg in 1955.

[...] I was invited by the US government under "Operation Paperclip" to come to the United States. In San Diego I met Ted Taylor and Freeman Dyson, who were working on the famous "Orion" nuclear bomb propulsion concept. This concept is generally credited to Ulam, but as I know from conversations I had with Heisenberg, a similar idea was presented to Heisenberg by Wernher von Braun, who had visited Heisenberg in Berlin in or around 1942.

Seventh Army Interrogation Center. 3 June 1945. Notes on German Weapons Developments. SAIC/38. https://www.scribd.com/document/431240796/File-Datastream http://hydrastg.library.cornell.edu/fedora/objects/nur:01298/datastreams/pdf/content

8. "Detonation Rocket Weapons"

Contrary to the normal rockets, where the projectile is propelled forward by the rearward push of the gases during the explosions, the "detonation rockets" move through the utilization of the rearward impulses caused by the detonations themselves. For practical purposes this principle is applicable only at extremely high velocities. The DERA is the only rocket in which this principle was used. Ing LARSSON (source) was the specialist in charge of research on this rocket at the GROSSENDORF Experimental Station, under Ing THOMAS. Source explains that the successive detonation impulses are properly directed by means of a parabolic surface. Normal rocket mechanisms are used to attain a certain minimum velocity, at which time the "detonation" mechanism begins to function.

E.5.4 Electric Rocket Propulsion

[Electric rocket propulsion, or an ion-electron thruster, uses energy (heat, resonant electromagnetic waves, high-energy electrons from an electron gun, or other methods) to ionize initially electrically neutral propellant atoms into positively charged ions and negatively charged electrons, as shown in the upper half of Fig. 9.241. The positively charged ions are accelerated by the voltage difference between two electrically charged grids and ejected from the rear of the spacecraft at some desired velocity. To prevent the spacecraft from accumulating more and more net electric charge (as a result of the lost ions) that would actually draw the ejected ions back to the spacecraft, electrons that have been stripped off the ions must also be ejected, generally by harvesting them from the ionization chamber and firing them from electron guns toward the departing ion exhaust. This method of particle acceleration can produce much higher exhaust velocities than chemical combustion or even fission thermal rockets. However, because charged particle beams have far lower densities than flows of more traditional rocket propellant, their thrust is very low. Thus electric propulsion is best for deep space missions where a low thrust applied over the course of months or even years can yield useful final velocities or changes in the spacecraft's orbit. Although ion-electron thrusters could be powered by solar panels or any other source of electrical energy, it is usually proposed to power them with a fission reactor.

Electric rocket propulsion systems were first proposed by Hermann Oberth in 1929 (see below). Experimental development of electric propulsion in Germany began no later than 1937 and continued until at least 1944 (p. 5311). Ernst Stuhlinger, Wernher von Braun, and other German-speaking scientists continued to develop and promote electric propulsion after the war (p. 1958 and the document below). Currently very few documents on the wartime electric propulsion program are available, but it seems likely that Oberth, Stuhlinger, and von Braun were involved in it as well.]

Ernst Stuhlinger. 1964. *Ion Propulsion for Space Flight.* New York: McGraw-Hill. pp. vii, 2–3.

The present book was written during the years 1958 to 1962. From 1960 to 1961, the author directed the NASA program for the development of arc-jet and ion propulsion systems at the George C. Marshall Space Flight Center in Huntsville, Alabama. [...]

Hermann Oberth [...] contributed probably more to the theoretical foundation of the broad field of rockets and space flight than any other individual. [...] Many of his early thoughts found precipitation in the book "Wege zur Raumschiffahrt" (1929), probably the outstanding classic of rocketry and space travel. One chapter in this book deals with electric propulsion. In a later book, "Man into Space" (1957), the same ideas were taken up again and presented in a similar form. Oberth first described the old classroom experiment where a needlepoint, connected with a source of high voltage, produces an "electric wind," and he then elaborated on methods of generating a flow of electrically charged particles from the thrust engine of a space vehicle. Porous plates, he wrote, will provide a finely dispersed flow of propellant; high voltage applied to the plates will form a spray of charged particles which leaves the vehicle with high velocity. Almost any kind of material, even refuse from the vehicle crew, could be used as propellant. The rate of propellant flow will always be small, but since the exhaust velocity is high, a noticeable thrust will be developed. It is characteristic of electric propulsion engines that they will produce a low thrust over a long period of time; hence, electric systems will find application in space vehicles which are designed to travel to distant targets.

E.5.5 Antimatter Rocket Propulsion

[For equal amounts of matter and antimatter, 100% of the combined propellant mass could be converted to energy, versus $< 1\%$ for nuclear reactions, so antimatter propulsion could yield the maximum performance obtainable from a rocket, with exhaust velocities approaching the speed of light. Eugen Sänger was the first to propose matter-antimatter rockets and to work out their details, including using anti-hydrogen made from positrons and antiprotons, storing the antimatter without letting it come into contact with ordinary matter, and using highly novel types of nozzles to direct the matter-antimatter reaction products out the back of the rocket. Sänger did a great deal of work in this area after the war; it is possible that he did some related theoretical design work during the war as well. See Figs. 9.241 and 9.243.]

Eugen Sänger. 1965. *Space Flight: Countdown for the Future.* New York: McGraw-Hill. pp. 255–258. [This English translation of Sänger's original German book is rather sloppy. I have adjusted a few words to try to improve the accuracy.]

Pure photon rockets represent the final, though today still entirely hypothetical, goal of all rocket systems. It is expected of them that they will transform all of the propellant mass carried aboard the vehicle into energy. The directed exhaust of this energy, at the speed of light of 300,000 km/sec, corresponds to the absolute, lowest limiting value of the specific propellant consumption of rocket engines at 3.3×10^{-5} kg/ton-sec. [...]

An exhaust velocity of all propellants carried aboard which is equal to the speed of light will also permit a similarly close approximation of the flight velocity to the speed of light so that the relativistic effects, particularly the phenomenon of time dilation between launch site and spacecraft, will figure prominently in the flight mechanics involved. [...]

At the time when the idea of the photon rocket was conceived, the existence of positrons as antiparticles of electrons was already known. Soon thereafter followed the discovery of the antiproton as the antiparticle of the proton so that now the combination of a positron and an antiproton to form an antihydrogen atom seems quite feasible. The first building blocks of antimatter became visible at the horizon, of that antimatter which might annihilate spontaneously upon collision with the matter of our ordinary world, thus disintegrating into photons whose energy is equivalent to the rest mass of the matter from which they originated. [...]

At present there is no certainty at all as to whether the annihilation of matter and antimatter is the only method by which matter can be transformed into energy. [...]

The latter process would be more advantageous than the combination of matter and antimatter insofar as obviating the problem of storing large quantities of antimatter, which has to be protected from any contact with ordinary matter. [...]

Meanwhile basic research in pure photon rockets has made considerable progress toward the solution of a related problem, namely that of the generation and collimation of very intensive photon rays.

E.6 Analysis of Advanced Jet Developments

Very simple mathematical models of aircraft performance may be derived from first principles, and then applied to estimate the performance of various types of German aircraft.

The frame of reference is important for analyzing aircraft engines. In the frame of reference of the atmospheric air surrounding the aircraft (motionless if there is no wind, or moving with the wind if the wind speed is nonzero), the surrounding air has zero velocity and the aircraft has a forward velocity v_{aircraft} [Fig. E.266(a)]. The exhaust velocity v_{exh} from the aircraft's engines is measured relative to the aircraft, so in the frame of reference of the surrounding air, the exhaust has a rearward velocity of $v_{\text{exh}} - v_{\text{aircraft}}$. However, it is much easier to analyze aircraft engine performance in the frame of reference of the aircraft, in which the surrounding atmospheric air has a rearward velocity of v_{aircraft}, the aircraft has zero velocity, and the engine exhaust has a rearward velocity of v_{exh} [Fig. E.266(b)].

In either frame of reference, $\dot{m}$ is the mass of air per time flowing through the engine. Aircraft engines are generally powered by burning fuel stored on-board with the air flowing through; the rate at which fuel is added is $\dot{m}_{\text{fuel}}$, which is typically far smaller than the air flow rate $\dot{m}$. In the rest frame of the aircraft [Fig. E.266(b)], the momentum flow rate entering the engine is $\dot{m}v_{\text{aircraft}}$, and that leaving the engine is $(\dot{m} + \dot{m}_{\text{fuel}})v_{\text{exh}} \approx \dot{m}v_{\text{exh}}$.

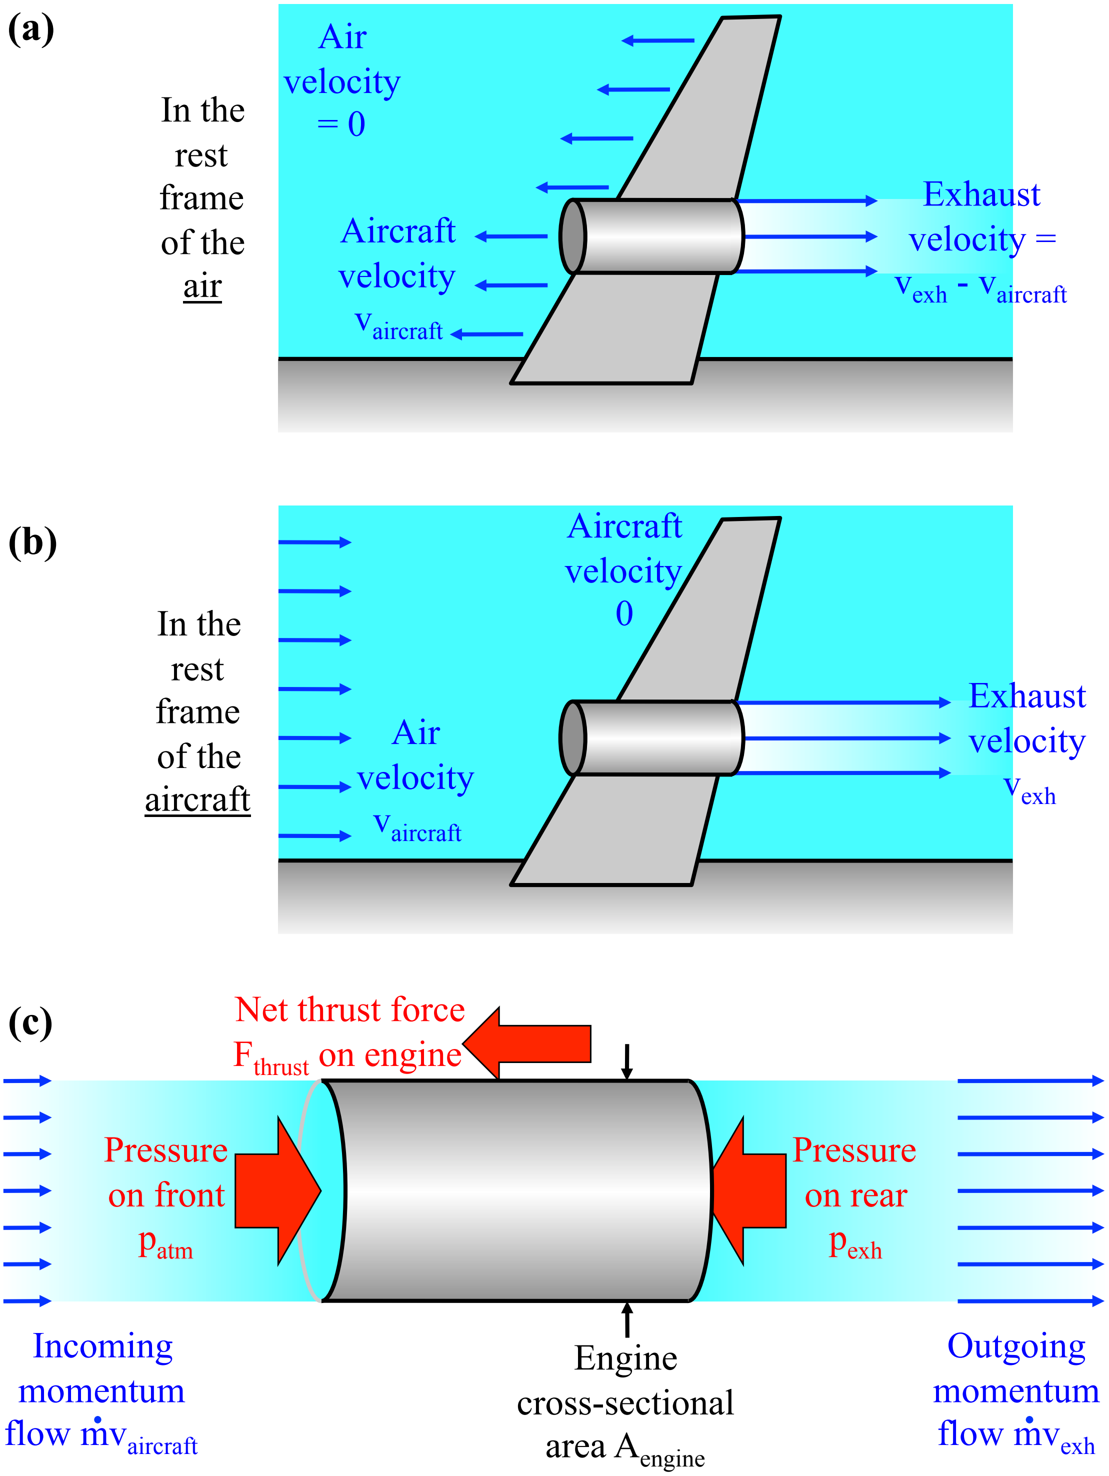
The thrust force of the engine is the net change in momentum flow rate before and after passing through the engine (creating an equal and opposite momentum change or force on the engine), plus the net difference between the pressure p_{exhaust} pushing on the rear cross-sectional area A_{engine} of the engine and the pressure p_{atm} pushing on the front cross-sectional area A_{engine} of the engine:

$$F_{\text{thrust}} = (\dot{m} + \dot{m}_{\text{fuel}})v_{\text{exh}} - \dot{m}v_{\text{aircraft}} + A_{\text{engine}}(p_{\text{exh}} - p_{\text{atm}}) \tag{E.1}$$

$$\approx (\dot{m} + \dot{m}_{\text{fuel}})v_{\text{exh}} - \dot{m}v_{\text{aircraft}} \tag{E.2}$$

$$\approx \dot{m}(v_{\text{exh}} - v_{\text{aircraft}}) \tag{E.3}$$

Equation (E.3) was further simplified by assuming $\dot{m}_{\text{fuel}} \ll \dot{m}$. Because the exhaust pressure exerts a forward force against nozzle surfaces, it is advantageous to let the exhaust expand within the nozzle until its pressure has finally fallen to the external atmospheric pressure. During that time, the pressure potential energy of the flow is steadily converted into kinetic energy of the increasing exhaust velocity. Since the exhaust velocity gets multiplied by the typically large mass flow rate $\dot{m}$ in Eq. (E.1), that also maximizes the thrust. If the nozzle expands the exhaust until its pressure is below atmospheric pressure, that creates a net drag and reduces the thrust as shown in Eq. (E.1). If the nozzle expands the exhaust until it reaches external ambient pressure, the exhaust is said to fully expanded. Exhaust at higher than external ambient pressure is under expanded, and exhaust at lower than ambient pressure is over expanded. The nozzle shape and size of a given aircraft engine are designed to fully expand the flow until expected operating conditions for that engine, so the pressure term in Eq. (E.1) is generally zero or negligibly small, as assumed in Eqs. (E.2)–(E.3). Aircraft such as supersonic fighter jets that must operate under a variety of conditions use nozzles with moveable surfaces so that the nozzle shape and the degree of exhaust expansion can be tailored for maximum efficiency at the current conditions.



(a)
In the rest frame of the air
Air velocity = 0
Aircraft velocity $v_{aircraft}$
Exhaust velocity = v_{exh} - $v_{aircraft}$
(b)
In the rest frame of the aircraft
Aircraft velocity 0
Air velocity $v_{aircraft}$
Exhaust velocity v_{exh}
(c)
Net thrust force F_{thrust} on engine
Pressure on front p_{atm}
Pressure on rear p_{exh}
Incoming momentum flow $\dot{m}v_{aircraft}$
Engine cross-sectional area A_{engine}
Outgoing momentum flow $\dot{m}v_{exh}$

Figure E.266: Basics of aircraft propulsion. (a) Relative velocities of the atmospheric air, aircraft, and exhaust in the rest frame of the air. (b) Relative velocities of the atmospheric air, aircraft, and exhaust in the rest frame of the aircraft. (c) Factors affecting the thrust of an aircraft engine in the rest frame of the aircraft.

An aircraft propulsion system converts the chemical energy stored in on-board fuel into thermal energy by burning the fuel with oxygen from the surrounding air. As with any other heat engine, an aircraft propulsion system then converts some fraction of that thermal energy into kinetic energy (of the exhaust and/or aircraft), while the rest remains as waste heat energy that is exhausted to the surrounding air. The thermodynamic efficiency η_{thermo} of an aircraft engine is defined as follows and will be less than the Carnot efficiency:

$$\eta_{\text{thermo}} = \frac{\text{Energy converted to kinetic energy of aircraft or exhaust}}{\text{Total heat energy produced by combustion}} \tag{E.4}$$

$$< 1 - \frac{T_{\text{highest temperature in engine}}}{T_{\text{external air}}} \tag{E.5}$$

Since the work or energy put into an object is equal to the product of the applied force and the distance that force moves the object, the power (energy/time) put into an object is equal to the product of the applied force and the object's instantaneous velocity. Therefore in the rest frame of the surrounding air [Fig. E.266(a)], the rate of increase (denoted by an overhead dot) of the kinetic energy of the aircraft is simply the product of the thrust force on the aircraft and the aircraft's instantaneous velocity:

$$(\dot{\text{KE}})_{\text{aircraft}} = F_{\text{thrust}}\, v_{\text{aircraft}} \tag{E.6}$$

$$\approx \dot{m}(v_{\text{exh}} - v_{\text{aircraft}})v_{\text{aircraft}} \tag{E.7}$$

in which Eq. (E.7) used Eq. (E.3) for the thrust.

Likewise, in the rest frame of the surrounding air [Fig. E.266(a)], air has zero velocity before and velocity $v_{\text{exh}} - v_{\text{aircraft}}$ after passing through the engine, so the rate of increase of the kinetic energy of the exhausted air is:

$$(\dot{\text{KE}})_{\text{exh}} = \frac{1}{2}\dot{m}(v_{\text{exh}} - v_{\text{aircraft}})^2 \tag{E.8}$$

The propulsive efficiency η_{prop} is defined as the fraction of the total produced kinetic energy that ends up with the aircraft and not the exhaust:

$$\eta_{\text{prop}} = \frac{(\dot{\text{KE}})_{\text{aircraft}}}{(\dot{\text{KE}})_{\text{aircraft}} + (\dot{\text{KE}})_{\text{exh}}} \tag{E.9}$$

$$= \frac{\dot{m}(v_{\text{exh}} - v_{\text{aircraft}})v_{\text{aircraft}}}{\dot{m}(v_{\text{exh}} - v_{\text{aircraft}})v_{\text{aircraft}} + (1/2)\dot{m}(v_{\text{exh}} - v_{\text{aircraft}})^2} \tag{E.10}$$

$$= \frac{2}{1 + (v_{\text{exh}}/v_{\text{aircraft}})} \tag{E.11}$$

Note from Eq. (E.11) that the propulsive efficiency increases as the exhaust velocity decreases. A propulsive efficiency greater than 1 is nonphysical, since it would require $v_{\mathrm{exh}} < v_{\mathrm{aircraft}}$, or negative thrust due to the aircraft engine actually decelerating air passing through it, creating a net drag on the aircraft. A propulsive efficiency of 1 can be approached by making v_{exh} slightly larger than but as close to v_{aircraft} as possible, although of course in that case the thrust from Eq. (E.3) also goes to zero. For $v_{\mathrm{exh}} \gg v_{\mathrm{aircraft}}$, the thrust from Eq. (E.3) is very high, but the propulsive efficiency from Eq. (E.11) is very low–most of the kinetic energy ends up with the exhaust and not the aircraft. In practice, an aircraft engine's exhaust velocity must always be chosen based on the tradeoffs between the relative importance of high-thrust and high-efficiency operation.

The total efficiency of an aircraft engine is the product of its thermodynamic efficiency in converting heat to kinetic energy, and its propulsive efficiency in converting that kinetic energy to motion of the aircraft instead of the exhaust:

$$\eta_{\mathrm{total}} = \eta_{\mathrm{prop}}\, \eta_{\mathrm{thermo}} \tag{E.12}$$

The specific impulse I_{sp} is the "bounce per ounce" of the fuel, the ratio of thrust produced to fuel consumed:

$$I_{\mathrm{sp}} = \frac{F_{\mathrm{thrust}}}{\dot{m}_{\mathrm{fuel}}\, g} \tag{E.13}$$

in which $g \approx 9.807$ m/sec^2 is the earth's surface gravitational acceleration, multiplied by $\dot{m}_{\mathrm{fuel}}$ so the fuel consumption is considered in terms of weight (force) per time and not mass per time.

Another oft-cited parameter is the thrust specific fuel consumption (TSFC), which is simply the inverse of the specific impulse:

$$\mathrm{TSFC} = \frac{1}{I_{\mathrm{sp}}} = \frac{\dot{m}_{\mathrm{fuel}}\, g}{F_{\mathrm{thrust}}} \tag{E.14}$$

By historical convention, I_{sp} is usually measured in seconds, yet TSFC is usually measured in inverse hours. Occasionally I_{sp} and/or TSFC are defined without the factor of g, resulting in more complicated units, but we won't worry about that here. Higher I_{sp} and lower TSFC both mean better fuel efficiency, with more thrust resulting from less fuel consumed. Typical values for different types of aircraft engines are:

$$\text{Turbojet engine:} \quad I_{\mathrm{sp}} \approx 3600 \text{ sec} \qquad \mathrm{TSFC} \approx 1.0 \text{ hr}^{-1} \tag{E.15}$$

$$\text{Turbofan engine:} \quad I_{\mathrm{sp}} \approx 6000 \text{ sec} \qquad \mathrm{TSFC} \approx 0.6 \text{ hr}^{-1} \tag{E.16}$$

$$\text{Propeller piston engine:} \quad I_{\mathrm{sp}} \approx 6500 \text{ sec} \qquad \mathrm{TSFC} \approx 0.55 \text{ hr}^{-1} \tag{E.17}$$

$$\text{Turboprop engine:} \quad I_{\mathrm{sp}} \approx 12,000 \text{ sec} \qquad \mathrm{TSFC} \approx 0.3 \text{ hr}^{-1} \tag{E.18}$$

One can use the specific impulse (or TSFC) to estimate an aircraft's maximum flying time Δt at cruising conditions, neglecting takeoffs and landings. Due to fuel consumption, the aircraft's weight W changes at a rate $dW/dt = -\dot{m}_{\text{fuel}}\, g$, so the specific impulse from Eq. (E.13) may be rewritten as:

$$I_{\text{sp}} = -\frac{F_{\text{thrust}}}{dW/dt} \tag{E.19}$$

$$dt = -\frac{I_{\text{sp}}}{F_{\text{thrust}}}\, dW = -I_{\text{sp}}\, \frac{L}{D}\, \frac{dW}{W} \tag{E.20}$$

$$= -I_{\text{sp}}\, \frac{C_L}{C_D}\, \frac{dW}{W} \tag{E.21}$$

Equations (E.20) and (E.21) used the facts that for an aircraft at steady cruising conditions, the forward thrust force must balance the rearward aerodynamic drag force D ($F_{\text{thrust}} = D$), the downward weight must balance the upward aerodynamic lift L ($W = L$), and the ratio of the lift and drag forces is simply the ratio of the lift and drag coefficients and can be assumed constant ($L/D = C_L/C_D$). Integrating Eq. (E.21) yields the maximum flying time:

$$\Delta t = I_{\text{sp}}\, \frac{C_L}{C_D}\, \ln\left(\frac{W_{\text{initial}}}{W_{\text{final}}}\right) = I_{\text{sp}}\, \frac{C_L}{C_D}\, \ln\left(\frac{M_{\text{initial}}}{M_{\text{final}}}\right) \tag{E.22}$$

The aircraft's maximum range R is just the product of its cruising speed v_{aircraft} and Δt:

$$R = v_{\text{aircraft}}\, \Delta t \tag{E.23}$$

$$= v_{\text{aircraft}}\, I_{\text{sp}}\, \frac{C_L}{C_D}\, \ln\left(\frac{M_{\text{initial}}}{M_{\text{final}}}\right) \tag{E.24}$$

As a sanity check, Eq. (E.24) can be applied to the U.S. Boeing B-29 bombers that were used to deliver the bombs to Hiroshima and Nagasaki. Using typical values of $v_{\text{aircraft}} \approx 100$ m/sec (Mach 0.33 at an altitude of 9–10 km), $I_{\text{sp}} \approx 6500$ sec for piston-powered propeller engines, $C_L/C_D \approx 16.8$, and $M_{\text{final}}/M_{\text{initial}} \approx 0.62$ (38% of the initial aircraft weight is fuel) yields

$$R \approx (100 \text{ m/sec})\, (6500 \text{ sec})\, (16.8)\, \ln\left(\frac{1}{0.62}\right) \tag{E.25}$$

$$\approx 5220 \text{ km} \approx 3240 \text{ mi} \tag{E.26}$$

Thus despite the simplifying assumptions involved in this method, the calculated range is in excellent agreement with the actual 5230 km (3250 mi) range of the B-29.

Equation (E.24) can also be applied to calculate the maximum theoretical range of various possible categories of German bombers. Like the B-29, such bombers would have had a likely cruising altitude of 9–10 km, where the speed of sound (Mach 1) is approximately 300 m/sec. Piston-powered propeller aircraft might have been designed to cruise at Mach 0.33 $\approx$ 100 m/sec with $I_{\rm sp} \approx 6500$ sec like the B-29. Turboprop aircraft might have been designed to cruise at Mach 0.5 $\approx$ 150 m/sec with $I_{\rm sp} \approx 12,000$ sec. Turbojet and turbofan aircraft might have been designed to cruise at Mach 0.8 $\approx$ 240 m/sec, with $I_{\rm sp} \approx 3600$ sec for turbojets and $I_{\rm sp} \approx 6000$ sec for turbofans. For all categories of aircraft, the largest likely lift-to-drag ratio would have been $C_L/C_D \approx 20$. The mass ratio likely would have been around $M_{\rm final}/M_{\rm initial} \approx 0.6$ (40% of the initial aircraft weight is fuel), although one can also consider the very optimistic case with $M_{\rm final}/M_{\rm initial} \approx 0.5$ (50% of the initial aircraft weight is fuel). Using Eq. (E.24), Tables E.1–E.2 present the results for these cases.

Characteristic	**Piston prop**	**Turbojet**	**Turbofan**	**Turboprop**
Cruising velocity v	100 m/sec	240 m/sec	240 m/sec	150 m/sec
Specific impulse $I_{\rm sp}$	6500 sec	3600 sec	6000 sec	12,000 sec
Lift/drag ratio C_L/C_D	20	20	20	20
Mass ratio $M_{\rm final}/M_{\rm initial}$	0.6	0.6	0.6	0.6
Maximum range R	6600 km	8800 km	15,000 km	18,000 km

Table E.1: Estimated characteristics and corresponding calculated maximum ranges for German bombers with a mass ratio $M_{\rm final}/M_{\rm initial} = 0.6$ using piston propeller, turbojet, turbofan, or turboprop engines.

Characteristic	**Piston prop**	**Turbojet**	**Turbofan**	**Turboprop**
Cruising velocity v	100 m/sec	240 m/sec	240 m/sec	150 m/sec
Specific impulse $I_{\rm sp}$	6500 sec	3600 sec	6000 sec	12,000 sec
Lift/drag ratio C_L/C_D	20	20	20	20
Mass ratio $M_{\rm final}/M_{\rm initial}$	0.5	0.5	0.5	0.5
Maximum range R	9000 km	12,000 km	20,000 km	25,000 km

Table E.2: Estimated characteristics and corresponding calculated maximum ranges for German bombers with a mass ratio $M_{\rm final}/M_{\rm initial} = 0.5$ using piston propeller, turbojet, turbofan, or turboprop engines.

German bombers likely would have been designed to make a round trip so that they and their crews could be reused if they survived the trip. New York seemed to be the preferred U.S. target mentioned by the German military; it was larger and also somewhat closer than Washington D.C.

The German launching point furthest west would have been someplace like Brest on the French coast, although such options were no longer available after the Allied invasion beginning in June 1944. (Intelligence about German plans might explain why the Allied invasion occurred when and where it did.) The distance from Brest to New York is approximately 5,400 km one-way, or 10,800 km round-trip.

A viable launching point up until the end of the war would have been the large German airfields around Oslo, Norway (Section E.1). The distance from Oslo to New York is approximately 6000 km one-way, or 12,000 km round-trip.

From these trans-Atlantic distances and Tables E.1–E.2, piston aircraft (such as the Ju 290) might have been able to make the one-way trip, but they certainly would not have been able to return to their launching point.

From Tables E.1–E.2, bombers powered by turbojets, the most readily available new aircraft engines in Germany, could have comfortably made a one-way trip. However, they would have had to operate at their maximum theoretical limits, with the best possible engine performance, lift/drag ratio, and mass ratio, in order to be able to make a 12,000 km round trip from Oslo to New York. Given realistic factors involved with technologies, missions, and payloads, that level of performance seems unlikely. Moreover, it would have been even more difficult to push that sort of technology to even greater ranges to reach other destinations (e.g., 12,500 km round trip from Oslo to Washington D.C. or 13,000 km round trip to Chicago).

Based on these fundamental considerations, aircraft powered by turbofan or turboprop engines would have been by far the best options for such round-trip missions.

Karl Leist (German, 1901–1960) built and demonstrated the first functional turbofan engine, the Daimler-Benz DB 007, also known as the Zweikreis Turbinen-Luftstrahltriebwerk ZTL 6001 (began development 1939, first run 1 April 1943). See pp. 1746, 5233–5241. At least three DB 007 turbofan engines were produced. The Heinkel company was also developing turbofan engines.

There were several notable turboprop engine development projects, including the Jumo 022 (p. 1748), BMW 028 (p. 1748), and Heinkel He S 021 (a turboprop version of the He S 011, p. 1731).

According to official histories, none of the turbofan or turboprop engines were used on aircraft before the end of the war. However, historians should carefully investigate whether some of the turbofan or turboprop work may have actually progressed further during the war, and how much it influenced postwar work on turbofan and turboprop engines, in view of:

1. The high priority placed on intercontinental jet bombers in the final years of the war.
2. The significantly higher fuel efficiency and hence longer range enabled by turbofan and turboprop engines compared to turbojet engines.
3. The great secrecy with which both wartime German scientists and postwar Allied investigators would have handled jet engine technology that was so advanced and had such strategic implications for intercontinental bombing.

E.7 Analysis of Advanced Rocket Developments

Very simple mathematical models of rocket performance may be derived from first principles, and then applied to estimate the performance of a wide variety of German rockets.

E.7.1 Fundamentals of Rocket Performance

A rocket expels exhaust rearward, accelerating the rocket forward as an equal and opposite reaction by Newton's laws. Ignoring forces such as gravity and aerodynamic drag for the moment, the maximum final velocity of the rocket depends on the mass $m_{\text{propellant}}$ of the propellant that is expelled as exhaust, the mass m_{final} of the empty rocket, and the velocity v_{exh} of the exhaust relative to the rocket. The result will also depend on whether the rocket body is divided into multiple stages that can be jettisoned along the way after the propellant in each stage has been consumed. One can derive a simple result for a single-stage rocket. By treating the rocket and exhaust as one combined system with a total momentum $p = p_{\text{rocket}} + p_{\text{exhaust}}$, and designating the current mass of the rocket and any remaining propellant it contains as m, conservation of total momentum yields:

$$\frac{dp_{\text{rocket}}}{dt} = -\frac{dp_{\text{exhaust}}}{dt} \tag{E.27}$$

$$m\frac{dv}{dt} = -\left(-v_{\text{exh}}\right)\left(-\frac{dm}{dt}\right) \tag{E.28}$$

$$\frac{dv}{dt} = -\frac{v_{\text{exh}}}{m}\frac{dm}{dt} \tag{E.29}$$

$$\int dv = -v_{\text{exh}}\int \frac{dm}{m} \tag{E.30}$$

$$\Delta v = v_{\text{final}} - v_{\text{initial}} = v_{\text{exh}} \ln\left(\frac{m_{\text{initial}}}{m_{\text{final}}}\right) \tag{E.31}$$

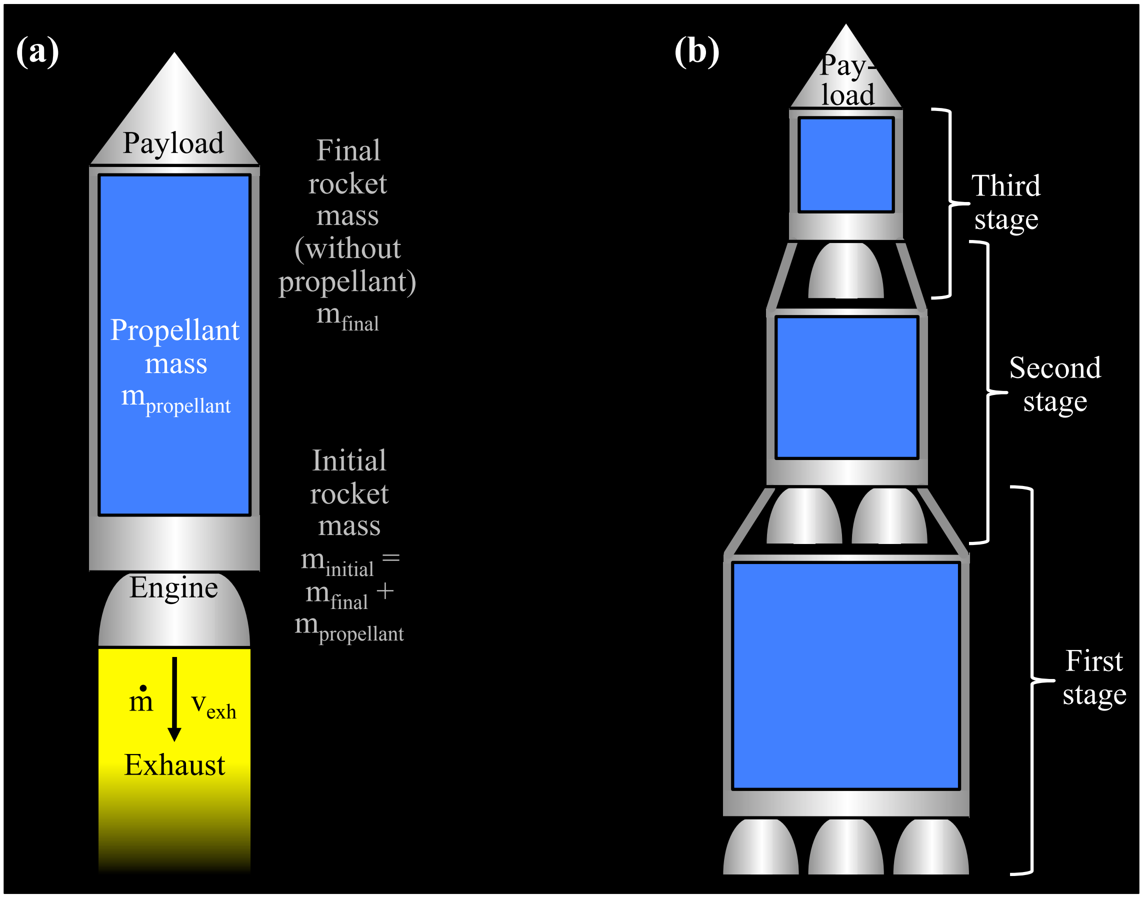
in which v_{initial} is the initial velocity of the rocket before consuming its propellant, v_{final} is the final velocity of the rocket after consuming its propellant, $\Delta v = v_{\text{final}} - v_{\text{initial}}$ is the net change in velocity, and $m_{\text{initial}} = m_{\text{final}} + m_{\text{propellant}}$ is the initial mass of the rocket including propellant.

Equation (E.31) may be extended to cover rockets with two or more stages:

$$\Delta v = \left(v_{\text{exh}}\right)_1 \ln\left[\frac{(m_{\text{initial}})_1}{(m_{\text{final}})_1}\right] + \left(v_{\text{exh}}\right)_2 \ln\left[\frac{(m_{\text{initial}})_2}{(m_{\text{final}})_2}\right] + \ldots \tag{E.32}$$

in which $(v_{\text{exh}})_1$ is the exhaust velocity of the rocket engine(s) on stage 1, $(m_{\text{initial}})_1$ is the initial mass of the entire remaining rocket when stage 1 begins its burn, and $(m_{\text{final}})_1$ is the final mass of the entire remaining rocket when stage 1 finishes its burn, and so forth for stage 2 and any higher stages. After one stage has used all of its propellant, it is jettisoned and the next stage takes over. For most rocket stages, $(m_{\text{initial}})_i/(m_{\text{final}})_i \sim 2-4$ and $(\Delta v)_i \sim (v_{\text{exh}})_i$, so the total velocity change is typically $\Delta v \sim \sum_i (v_{\text{exh}})_i$.

From Eqs. (E.27)-(E.28), the exhaust exerts an equal and opposite thrust force F_{thrust} on the rocket, so the thrust, exhaust velocity, propellant mass, and burn time t_{burn} required to consume that propellant are interrelated:



(a)
Payload
Final rocket mass (without propellant) m_final
Propellant mass m_propellant
Initial rocket mass m_initial = m_final + m_propellant

Third stage
Second stage
First stage

Figure E.267: Rockets (a) store propellant onboard and expel it out the back at a rate dm/dt and with an exhaust velocity v_{exh}, and (b) may be divided into multiple stages, such that each can be jettisoned as soon as its propellant has been consumed, reducing the rocket's mass later in flight and improving its overall performance.

$$\begin{aligned} \frac{dp_{\text{exhaust}}}{dt} &= v_{\text{exh}} \frac{dm}{dt}\,, \quad \text{or} \\ F_{\text{thrust}} &= v_{\text{exh}} \frac{m_{\text{propellant}}}{t_{\text{burn}}} \end{aligned} \tag{E.33}$$

The exhaust velocity can be expressed as the product of the earth's standard gravitational acceleration $g \approx 9.807\ \text{m}/\text{sec}^2$ and the specific impulse I_{sp} (measured in units of seconds):

$$v_{\text{exh}} = I_{\text{sp}}\, g \tag{E.34}$$

One could get along just fine by discussing the exhaust velocity and never using its alter-ego, the specific impulse. However, specific impulse became a widespread term of convention among rocket scientists since from Eqs. (E.33) and (E.34), it is basically the "bounce per ounce" of the propellant, the thrust force per propellant flow rate (weight per second):

$$I_{\text{sp}} = \frac{F_{\text{thrust}}}{g\, m_{\text{propellant}}/t_{\text{burn}}} \tag{E.35}$$

Liquid propellant rockets can achieve higher specific impulses/exhaust velocities than solid propellant rockets, but since liquid propellants are often cryogenic or chemically degrade over time, they usually cannot be stored for more than a few days. Therefore, they are primarily used for spacecraft launch vehicles, which can be fueled shortly before launch.

Figure E.268 shows schematic views of a liquid propellant rocket engine. As illustrated in Fig. E.268(a), burning of fuel and oxidizer in the combustion chamber generates hot gas with velocity $v_{\text{chamber}} \approx 0$ (initially nearly motionless in the combustion chamber, at least compared to the very high exhaust velocity coming out of the nozzle), pressure p_{chamber}, and temperature T_{chamber}. The hot gas expands in the nozzle until it has exhaust velocity v_{exh}, pressure p_{exh}, and temperature T_{exh} when it exits. For comparison, the ambient pressure outside the nozzle is p_{ambient}, which may be significant if the rocket is still inside the atmosphere.

Figure E.268(b) shows a schematic view of other components in a liquid propellant rocket engine. Pumps raise the pressure of oxidizer and fuel drawn from the propellant storage tanks to a pressure higher than p_{chamber} so they can be injected into the combustion chamber. Before entering the combustion chamber, fuel passes through coils wrapping the combustion chamber and nozzle, cooling the engine and preheating the fuel. To power the pumps, small amounts of oxidizer and fuel are diverted to burn in a gas generator, producing hot exhaust that powers a gas turbine and thereby the pumps. In some liquid rocket engine designs, the gas generator is powered by a small amount of dedicated solid rocket propellant, rather than diverted liquid propellant. A few combinations of fuels and oxidizers are hypergolic, or ignite on contact with each other, but most are not hypergolic, and require an igniter similar to a spark plug in the ignition chamber (not shown).

Thrust vector control or steering of a liquid propellant rocket engine during its burn may be accomplished in any of several ways. Gimbaling or tilting the entire engine (both the nozzle and the combustion chamber) is commonly used on large modern rockets. It is also possible to tilt just the nozzle if it is connected to the combustion chamber by a flexible yet heat-resistant seal or joint. Older, simpler methods include moving heat-resistant rudders or vanes that protrude into the exhaust stream (the method of choice for the A-4 and related rockets), or injecting fluid into one side of the exhaust to divert the rest of the hot exhaust gas. Those simpler methods are still used on smaller modern rockets. Of course, if there are multiple engines, they can be tilted in different directions to control roll around the long axis of the rocket, as well as pitch and yaw (tilting one way or the other) of the rocket's long axis relative to its flight path.

If a rocket accelerates in bursts instead of continuously, the temporarily increased propellant pressure during a burst of acceleration can be amplified by the pumps, temporarily increase propellant flow to the engine, and thus reinforce the transient bursts of thrust and acceleration. This propellant instability is called pogo, since the rocket seems to vibrate like a toy pogo stick. (Pogo was even shown for the fictionalized depiction of an A-10 rocket engine in the 1965 film *Operation Crossbow.*) To prevent this problem, some rocket engines have pogo accumulators between the propellant tanks and the propellant pumps, such that gas-filled regions of the accumulators allow the liquid propellant to expand when necessary and dampen the pogo vibrations.

Figure E.268: Liquid propellant rocket design. (a) Burning of fuel and oxidizer in the combustion chamber generates hot gas with velocity $v_{\text{chamber}} \approx 0$, pressure p_{chamber}, and temperature T_{chamber}, which expands in the nozzle until it has exhaust values v_{exh}, p_{exh}, and T_{exh}. (b) Pumps raise the pressure of oxidizer and fuel from the storage tanks and inject it into the combustion chamber. Along the way, fuel detours through coils wrapping the combustion chamber and nozzle, cooling the engine and preheating the fuel. Small amounts of oxidizer and fuel are diverted to burn in a gas generator, producing hot exhaust that powers a gas turbine and thereby the pumps.

Burning of propellant in the combustion chamber produces an exhaust gas of molecules with both a high thermal energy due to the temperature T_{chamber} and also a high potential energy in the form of the pressure p_{chamber}. The rocket nozzle is shaped in such a way to convert as much as possible of that gas's thermal energy and pressure potential energy into directed kinetic energy of the molecules moving straight out of the rear of the nozzle. From basic thermodynamics, molecules with D degrees of freedom (three degrees of freedom for linear motion in three dimensions, plus three more degrees of freedom for rotation around three axes, plus more degrees of freedom if each molecular bond has enough energy to vibrate) will have an initial thermal energy of

$$\text{Thermal energy per mole} \quad = \quad \frac{D}{2} R_0 T_{\text{chamber}} \ , \tag{E.36}$$

in which the universal gas constant is $R_0 \approx 8314$ J/(kg ^{o}K).

Also from basic thermodynamics, the initial pressure potential energy will be

$$\text{Pressure energy per mole} \quad = \quad R_0 T_{\text{chamber}} \ . \tag{E.37}$$

The exhaust gas leaving the nozzle will have a kinetic energy of

$$\text{Kinetic energy per mole} \quad = \quad \frac{1}{2} (\text{M.W.}) v_{\text{exh}}^2 \ , \tag{E.38}$$

in which M.W. is the molecular weight of the exhaust molecules (basically the total number of protons and neutrons in each molecule).

Using Eqs. (E.36)–(E.38), if the rocket engine nozzle converts the initial thermal and pressure energy of the exahust to final kinetic energy with some conversion efficiency ϵ_{nozzle}, one can calculate the exhaust velocity:

$$\text{Kinetic energy per mole} \quad = \quad \text{Efficiency} \times (\text{Thermal energy per mole} \ + \ \text{Pressure energy per mole})$$

$$\begin{aligned}
\frac{1}{2} (\text{M.W.}) v_{\text{exh}}^2 \quad &= \quad \epsilon_{\text{nozzle}} \ \frac{D+2}{2} \ R_0 T_{\text{chamber}} \ , \quad \text{or} \\
v_{\text{exh}} \quad &= \quad \sqrt{\frac{\epsilon_{\text{nozzle}} (D+2) R_0 T_{\text{chamber}}}{\text{M.W.}}} \qquad \text{(E.39)}
\end{aligned}$$

$$I_{\text{sp}} \quad = \quad \frac{v_{\text{exh}}}{g} \quad = \quad \frac{1}{g} \sqrt{\frac{\epsilon_{\text{nozzle}} (D+2) R_0 T_{\text{chamber}}}{\text{M.W.}}} \tag{E.40}$$

Most exhaust products from chemical rockets are triatomic molecules (H_2O, CO_2, etc.) with $D =$ 8 degrees of freedom (linear motion in three dimensions, plus rotation around three axes, plus vibration of two bonds). Using that assumption and the values $R_0 \approx 8314$ J/(kg ^{o}K) and $g \approx 9.807$ m/sec^2, Eqs. (E.39)–(E.40) become

$$v_{\text{exh}} \quad = \quad 288.3 \sqrt{\frac{\epsilon_{\text{nozzle}}\, T_{\text{chamber}} \text{ (in }^o\text{K)}}{\text{M.W.}}} \;\; \frac{\text{meters}}{\text{sec}} \tag{E.41}$$

$$I_{\text{sp}} \quad = \quad 29.40 \sqrt{\frac{\epsilon_{\text{nozzle}}\, T_{\text{chamber}} \text{ (in }^o\text{K)}}{\text{M.W.}}} \;\; \text{sec} \tag{E.42}$$

The nozzle efficiency is $\epsilon_{\text{nozzle}} \approx 1$ for rocket engines designed to operate in the vacuum of space, where the nozzle can be so large that it expands the exhaust gas until its pressure is virtually zero, and all of the exhaust gas's energy has become kinetic energy. For rocket engines designed to operate within the atmosphere (generally launching from the surface, where the atmospheric pressure is greatest), the nozzle can only be large enough to expand the exhaust gas until its pressure reaches the pressure of the outside atmosphere. (If the nozzle expanded the exhaust to a pressure lower than that of the atmosphere, the rocket would lose thrust as a result of the higher atmospheric pressure "dragging" on the outside of the rocket nozzle that had lower exhaust pressure inside.) For sea-level atmospheric pressure, typical values of nozzle efficiency are around $\epsilon_{\text{nozzle}} \approx 0.64$ ($\sqrt{\epsilon_{\text{nozzle}}} \approx 0.8$).

The combustion chamber temperature T_{chamber} is limited not by any chemical properties of the propellants, but rather by the requirement not to damage the engine by overheating. Whereas jet engines (Section E.6) must run for hours without overheating, most rocket engines only need to operate for a few minutes, and their propellant can also circulate outside the combustion chamber and nozzle to cool the engine before the propellant is burned. As a result, rocket engine combustion chambers can operate at higher temperatures than jet engines, typically ranging from $T_{\text{chamber}} \sim 2200^o$K for the standard A-4 engine to $\sim 3500^o$K for most modern rocket engines.

The molecular weight (M.W.) of the exhaust depends on the propellant used. For hydrogen as fuel and oxygen as oxidizer, the reaction product is water (H_2O), with a molecular weight M.W. ≈ 18. To lower the average molecular weight, most hydrogen-oxygen engines burn hydrogen-rich; the excess molecular hydrogen (M.W. ≈ 2) in the exhaust reduces the average exhaust molecular weight to M.W. ≈ 12. Hydrogen/oxygen propellant yields the best performance currently available from chemical propellants, but both the fuel and oxidizer are cryogenic, so they cannot be stored in onboard tanks for long. Hydrogen also has a very low density even when liquified, so it requires a fairly large and massive fuel tank on a rocket. Despite these difficulties, hydrogen/oxygen is the preferred fuel for most stages of most modern launch vehicles.

Liquid oxygen may also be used with storable fuels such as ethanol (CH_3CH_2OH, as in the A-4) or petroleum oil derivatives (typically a mixture of molecules $\sim C_nH_{2n+2}$, where $n \sim 6$–20, as in some proposed German rockets or the first stage of the Saturn V). For a standard A-4 rocket with oxygen as oxidizer and 75% ethanol/25% water as fuel (the water was added both to cool the engine and to lower the average molecular weight of the exhaust), roughly 2/3 of the reaction products are water (M.W. ≈ 18) and roughly 1/3 are carbon dioxide (CO_2, M.W. ≈ 44), yielding an average molecular weight of M.W. ≈ 27. The effective molecular weight could vary slightly, depending on what the exact propellant mix was and how one does the averaging, but M.W. ≈ 27 is a representative number, and small variations in that number are relatively insignificant, since it is in the square root in Eqs. (E.41)–(E.42).

Using these values and Eqs. (E.41), Table E.3 presents the approximate sea-level ($\epsilon_{\text{nozzle}} \approx 0.64$) and vacuum ($\epsilon_{\text{nozzle}} \approx 1$) exhaust velocities for various propellants and combustion temperatures.

Rocket fuel	**Rocket oxidizer**	**Exhaust M.W.**	**Combustion temperature**	**Sea-level exh. velocity**	**Vacuum exh. velocity**
Hydrogen	Oxygen	12	2200^oK	3120 m/sec	3900 m/sec
Hydrogen	Oxygen	12	3500^oK	3940 m/sec	4920 m/sec
Ethanol	Oxygen	27	2200^oK	2080 m/sec	2600 m/sec
Ethanol	Oxygen	27	3500^oK	2630 m/sec	3280 m/sec
Fuel oil	Oxygen	27	2200^oK	2080 m/sec	2600 m/sec
Fuel oil	Oxygen	27	3500^oK	2630 m/sec	3280 m/sec

Table E.3: Approximate exhaust velocities for rocket engines with various propellants, different combustion temperatures, and exhaust nozzles optimized for either sea-level and or vacuum conditions.

The thrust of a rocket engine may be estimated from the physical size of the engine, or vice versa. The combustion chamber pressure p_{chamber} pushes on all the forward inside areas of the chamber, but not on the open throat area A_{throat} in the rear of the chamber, producing an imbalanced pressure-based thrust force of $p_{\text{chamber}}A_{\text{throat}}$. The velocity and mass escaping through the throat produce a momentum-based thrust force of comparable value, doubling the total. Including the nozzle efficiency ϵ_{nozzle}, the total thrust including both pressure and momentum effects is

$$F_{\text{thrust}} \approx 2\,\epsilon_{\text{nozzle}}\,p_{\text{chamber}}\,A_{\text{throat}} \tag{E.43}$$

Like the chamber temperature, the chamber pressure p_{chamber} is limited not by any chemical properties of the propellants, but rather by the stresses that the combustion chamber can endure. Chamber pressures vary from $p_{\text{chamber}} \approx 1.45$ MPa for the standard A-4 engine to $p_{\text{chamber}} \approx 20$ MPa for the Space Shuttle Main Engines. (For reference, sea-level atmospheric pressure is approximately 0.1 MPa.)

Expressing the chamber pressure in MPa and writing the throat area in terms of the throat diameter, $A_{\text{throat}} \approx (\pi/4)D_{\text{throat}}^2$, the thrust from Eq. (E.43) may be rewritten as:

$$F_{\text{thrust}} \ \text{[in Newtons]} \ \approx \ 1.6 \times 10^6 \, \epsilon_{\text{nozzle}} \, D_{\text{throat}}^2 \ \times \ p_{\text{chamber}} \ \text{[in MPa]} \tag{E.44}$$

For the standard A-4 engine with sea-level nozzle efficiency $\epsilon_{\text{nozzle}} \approx 0.64$, throat diameter $D_{\text{throat}} = 0.405$ m, and chamber pressure $p_{\text{chamber}} \approx 1.45$ MPa, Eq. (E.44) predicts a thrust of $F_{\text{thrust}} \approx 2.44 \times 10^5$ N, very close to the stated sea-level A-4 thrust of 2.65×10^5 N.

In order to reduce the exhaust gas pressure from the chamber pressure $p_{\text{chamber}} > 1$ MPa to atmospheric pressure $p_{\text{atm}} \sim 0.1$ MPa for a first-stage engine, the flared nozzle must have an exhaust area that is $A_{\text{exh}}/A_{\text{throat}} \sim$ 4–16 times as large as the throat area, or an exhaust diameter that is $D_{\text{exh}}/D_{\text{throat}} \sim$ 2–4 times as large as the throat diameter (taking the square root of the area ratio). Vacuum-optimized upper-stage engines typically have typical area ratios of $A_{\text{exh}}/A_{\text{throat}} \sim$ 25–100, or diameter ratios of $D_{\text{exh}}/D_{\text{throat}} \sim$ 5–10.

Although solid propellant rockets have lower specific impulses/exhaust velocities than liquid propellant rockets, they can generally be stored for years without degradation. Therefore, they are primarily used for military rockets and “off-the-shelf” boosters that can be strapped to the side of the first stage of a spacecraft launch vehicle. Despite their internal differences (see p. 1905), solid propellant rockets obey the same thrust equations derived above for liquid propellant rockets.

Very complex calculations would be required to analyze the performance of a rocket including factors such as the duration and angle of its rocket engine burn, aerodynamic drag, variations in the gravitational acceleration g, curvature of the earth, and rotation of the earth. However, for suborbital rockets, adequate approximations may be obtained using much simpler methods. As shown in Fig. E.269, major categories of potential flight paths for rockets include: (a) a ballistic trajectory, (b) a glide trajectory, (c) a ballistic trajectory followed by a glide trajectory, and (d) a ballistic trajectory with multiple skips off the upper atmosphere (followed by a glide).

a. Ballistic trajectory

For a crude but simple calculation of a ballistic trajectory (the path of a rocket without aerodynamic lift or wings), one can model the rocket's performance as that of a ballistic projectile which is instantaneously accelerated to a velocity Δv at launch, is fired some initial angle relative to the flat surface of the earth, and follows a parabolic trajectory to its target. Using Eq. (E.31) and assuming a 10% loss for aerodynamic drag and gravitational forces, the effective launch velocity of a ballistic rocket in this model is:

$$\Delta v \quad = \quad 0.9\, v_{\text{exh}} \, \ln\left(\frac{m_{\text{initial}}}{m_{\text{final}}}\right) \tag{E.45}$$

As shown in Fig. E.269(a), such a ballistic projectile achieves the greatest range when it is fired at a 45^o angle from the surface, devoting equal amounts of its velocity to achieving a maximum height and traveling a maximum distance before it falls back to the earth. If the projectile has a mass m and an initial velocity Δv, its total kinetic energy is $m(\Delta v)^2/2$, of which half goes to carry it to a maximum height ΔH and half goes to carry it to a maximum downrange distance Δx when it impacts at time Δt after being launched. Since half the initial kinetic energy is used up to achieve the gravitational potential energy $mg\Delta H$ at maximum height, that height may be found:

$$\frac{1}{2}\left[\frac{1}{2}m(\Delta v)^2\right] \quad = \quad m\, g\, \Delta H \ , \ \text{ or} \tag{E.46}$$

$$\Delta H \quad = \quad \frac{(\Delta v)^2}{4g} \tag{E.47}$$

Half of the total time Δt is spent reaching height ΔH, and half to fall from it back to the ground:

$$\Delta H \quad = \quad \frac{1}{2}\, g \left(\frac{\Delta t_{\text{ballistic}}}{2}\right)^2 \ , \ \text{ or} \tag{E.48}$$

$$\Delta t_{\text{ballistic}} \quad = \quad \sqrt{\frac{8\Delta H}{g}} \tag{E.49}$$

$$\quad = \quad \sqrt{2}\,\frac{\Delta v}{g} \tag{E.50}$$

in which Eq. (E.50) used Eq. (E.47).

An amount $\Delta v/\sqrt{2}$ of the projectile's velocity is directed horizontally, carrying it a distance

$$\Delta x_{\text{ballistic}} \quad = \quad \frac{\Delta v}{\sqrt{2}}\ \Delta t_{\text{ballistic}} \tag{E.51}$$

$$\quad = \quad \frac{(\Delta v)^2}{g} \tag{E.52}$$

in which Eq. (E.52) used Eq. (E.50).

Figure E.269: Major categories of potential flight paths for rockets include: (a) a ballistic trajectory, (b) a glide trajectory, (c) a ballistic trajectory followed by a glide trajectory, and (d) a ballistic trajectory with multiple skips off the upper atmosphere (followed by a glide).

b. Glide trajectory

In a gliding trajectory as illustrated in Fig. E.269(b), the rocket is boosted to an initial velocity Δv that is horizontal but high enough in the atmosphere that it will not crash before it loses its horizontal velocity. If the rocket has wings, it can use the aerodynamic lift force generated by those wings to maintain a nearly horizontal gliding flight path for as long as possible, until aerodynamic drag has slowed its forward velocity to zero (or in practice, to a low enough velocity that the wings no longer generate enough lift to keep the vehicle aloft).

For the rocket to maintain a horizontal trajectory, the upward lift force L must balance the downward gravitational force mg, in which m is the mass of the rocket and g is the gravitational acceleration:

$$L = mg \tag{E.53}$$

Using Newton's second law, the aerodynamic drag force D in the horizontal direction causes the rocket's forward velocity to decelerate at a rate a (where a is defined to be positive for deceleration):

$$D = ma \tag{E.54}$$

Dividing Eq. (E.54) by Eq. (E.53), one finds:

$$\frac{D}{L} = \frac{a}{g}\,, \quad \text{or}$$

$$a = g\,\frac{D}{L} \tag{E.55}$$

Note that the deceleration is constant and only depends on the rocket's lift-to-drag ratio (D/L). At that uniform deceleration, the time required to decelerate from initial velocity Δv to $v = 0$ is:

$$\begin{aligned} \Delta t_{\text{glide}} &= \frac{\Delta v}{a} \\ &= \frac{\Delta v}{g}\,\frac{L}{D} \end{aligned} \tag{E.56}$$

For uniform deceleration, the average velocity during the glide is $\Delta v/2$, so the range travelled during the glide is:

$$\begin{aligned} \Delta x_{\text{glide}} &= \frac{\Delta v}{2}\,\Delta t_{\text{glide}} \\ &= \frac{1}{2}\,\frac{L}{D}\,\frac{(\Delta v)^2}{g} \end{aligned} \tag{E.57}$$

Dividing Eq. (E.57) by Eq. (E.52), the range of a gliding trajectory compared to the range of a ballistic trajectory with the same initial velocity is:

$$\frac{\Delta x_{\text{glide}}}{\Delta x_{\text{ballistic}}} = \frac{1}{2}\frac{L}{D} \tag{E.58}$$

Thus the gliding range is at least as large as the ballistic range for lift-to-drag ratios of

$$\frac{L}{D} \geq 2 \tag{E.59}$$

For reference, the lift-to-drag ratio of the U.S. space shuttle was $L/D \approx 2.5$, and Silbervogel was designed to have L/D in the range 6.4–7.5 (the ratio varied slightly with the velocity of the vehicle).

c. Ballistic trajectory followed by a glide trajectory

As shown in Fig. E.269(c), greater range may be achieved if a rocket first follows a ballistic trajectory, then follows a glide trajectory. For simplicity, one can assume that the glide begins after the rocket's ballistic trajectory has fallen enough that the rocket has regained virtually all of its initial velocity Δv, yet is still high enough that it can glide nearly horizontally until its forward velocity is gone, without hitting the ground prematurely. With this simplistic but useful assumption, the total range travelled during both the ballistic and glide phases is:

$$\Delta x_{\text{total}} \approx \Delta x_{\text{ballistic}} + \Delta x_{\text{glide}} = \left(1 + \frac{1}{2}\frac{L}{D}\right)\frac{(\Delta v)^2}{g} \tag{E.60}$$

$$\approx \left(1 + \frac{1}{2}\frac{L}{D}\right)\Delta x_{\text{ballistic}} \tag{E.61}$$

If $L/D = 2$, adding a glide to the end of a ballistic trajectory would approximately double the total range, compared to a purely ballistic trajectory. If $L/D = 4$, adding a glide to the end of a ballistic trajectory would approximately triple the total range.

The total time required for both the ballistic and glide phases is:

$$\Delta t_{\text{total}} \approx \Delta t_{\text{ballistic}} + \Delta t_{\text{glide}} = \left(\sqrt{2} + \frac{L}{D}\right)\frac{\Delta v}{g} \tag{E.62}$$

$$\approx \left(1 + \frac{\sqrt{2}}{2}\frac{L}{D}\right)\Delta t_{\text{ballistic}} \tag{E.63}$$

d. Skip trajectory

In a skip trajectory as illustrated in Fig. E.269(d), the rocket follows an initial ballistic trajectory but then instead of gliding back through the atmosphere, it bounces off the upper atmosphere to follow a second ballistic trajectory. If the rocket has wings, it can use those wings to generate enough aerodynamic lift for the skip back out of the atmosphere, instead of a nearly horizontal glide. However, there will also be a corresponding amount of aerodynamic drag during the atmospheric skip, so the rocket will lose some of its velocity and the second ballistic trajectory will not achieve as much altitude or as much range as the first ballistic trajectory. In principle the rocket can execute several skips and several ballistic trajectories, each smaller than the preceding one, before eventually settling into a conventional glide trajectory. The skip trajectory is analogous to skipping a stone off the surface of a pond of water. The equations for the skip trajectory are too complicated to include here, but will be discussed in Section E.7.7. Yet even without equations, one can see that a skip trajectory has the potential to have a total range several times larger than a simple ballistic trajectory, and larger even than a combined ballistic and glide trajectory.

Methods of improving rocket performance

Throughout the war, Germany was strongly motivated to improve the performance of its rockets to increase their range in order to reach more distant targets, and/or to increase their payload capacity in order to deliver larger bombs (conventional explosive, incendiary, fuel-air explosive, fission, radiological, chemical, or biological). Once Allied military forces began advancing into territory previously held by Germany, making potential Allied targets like London and Moscow even further away, this motivation became even stronger.

The A-4 or V-2 rocket was the most successful, most visible, and most widely produced German rocket, and was able to carry a 1-ton payload to a maximum range of approximately 350 km. There were six major ways to improve its performance, which could be done individually or in any combinations:

- Increasing the size of the rocket.
- Increasing the exhaust velocity of the rocket engine.
- Adding a booster stage to the rocket.
- Adding strap-on boosters to the rocket.
- Adding wings to the rocket.
- Decreasing stresses during atmospheric reentry.

Evidence for wartime German progress on each of these approaches will now be analyzed.

E.7.2 Increasing the Size of the Rocket

Length was the most straightforward improvement, since it would have simply involved producing longer cylinders for the fuel and oxidizer tanks, and possibly increasing the propellant flow rate to the engine to produce more thrust to lift the larger rocket mass. Whereas the regular A-4 rocket was approximately 14 meters long, including the fins and nosecone, there is evidence for extended versions of the A-4, especially a ∼18-meter version and a ∼21-meter version. There is also evidence for larger rockets such as the A-10.

For some publicly available sources on the wartime development of rockets larger than the standard A-4, see for example:

Using German engineers, plans, and technologies after the war, the United States produced the Redstone missile, which was essentially a 21-meter-long A-4 (p. 5501).

Using German engineers, plans, and technologies after the war, France was developing and considering producing the Super V-2 missile, which was essentially an A-4 with enlarged propellant tanks (p. 5584).

Using German engineers, plans, and technologies after the war, the Soviet Union produced the SS-2 (R-2) missile, which was basically an 18-meter-long A-4, and the SS-3 (R-5M) missile, which was essentially a 21-meter-long A-4 (p. 5574).

Boris Chertok mentioned that the 21-m-long SS-3/R-5, but not the 14-m SS-1/R-1 and 18-m SS-2/R-2, suffered from unforeseen guidance problems. The SS-3 was so long that there was appreciable structural bending between the nose of the rocket, where the motion-sensing guidance system was, and the tail of the rocket, where the steering fins were. The guidance system erroneously interpreted small bending motions of the intervening structure as course changes of the entire rocket, and then led the rocket astray. (See pp. 5572–5572.) Because these Soviet rockets were directly based on German technology, it is likely that this same problem would have afflicted a 21-m A-4 but not 14-m or 18-m versions of the A-4. The wartime German program could certainly have overcome this problem just as the postwar Soviet program ultimately did, but it might have been one more cause for critical delays in the German rocket program.

Table E.4: Approximate values from known German (14-meter regular A-4), German-based Soviet (SS-1, SS-2, and SS-3), German-based French (Super V-2), and German-based U.S. (Redstone) rockets used to extrapolate characteristics of possible German extended A-4 rockets (18-meter and 21-meter versions) [data adapted from Jürgen Michels 1997; Uhl 2001; http://www.astronautix.com]. Extended German rockets may have also used kerosene (or other hydrocarbon fuel) and nitric acid oxidizer like the proposed Super V-2.

From Table E.4, note that the estimated altitude and range agree very well with the A-4 trajectory shown in Heinz Stoelzel's diagram in Fig. E.96.

E.7.3 Increasing the Exhaust Velocity of the Rocket Engine

Another way to improve the overall performance of the rocket would be to increase the exhaust velocity of the engine. This solution was presumably being pursued with better metal alloys and improved regenerative engine cooling systems to allow higher combustion temperatures, and improved fuels (especially liquid hydrogen) to lower the average molecular weight of the exhaust gas, since the range varies like:

$$\begin{aligned} \Delta x &\propto (\Delta v)^2 \propto v_{\rm exh}^2 \\ &\propto \frac{T_{\rm chamber}}{\rm M.W.} \end{aligned} \tag{E.64}$$

Because the range is directly proportional to the engine combustion chamber temperature, using more heat-resistant materials and increasing the temperature from 2200^oK (standard for the A-4) to 3500^oK (typical for modern rockets) would increase the range by a factor of

$$\frac{3500^o\text{K}}{2200^o\text{K}} \approx 1.59 \,, \tag{E.65}$$

or approximately 59%. For example, the maximum range of the A-4 would increase from approximately 350 km to approximately 557 km.

It seems likely that A-4 engines with higher combustion temperatures would have been actively researched and possibly even mass-produced during the war:

a. There was an urgent wartime demand for rockets with longer ranges, especially after D-Day as rockets had to be launched from deeper and deeper into the European continent.

b. German-led engineering teams in postwar Allied countries made simultaneous and similar improvements to A-4 engine technology to raise the combustion temperatures.

c. There were a number of wartime and early postwar documents that mentioned "improved V-2s."

d. Rocket engine testing was so important that a number of testing facilities were built and operated in addition to Peenemünde. If the engine technology was standardized and remained unchanged, those engine testing sites are harder to explain. (Ordinary quality control would have required less extensive testing of some fraction of the mass-produced engines.)

Indeed, there is at least one photograph from a postwar U.S. report showing an advanced A-4 engine that was apparently mass-produced (p. 5285). Much more archival research should be conducted to determine the performance characteristics and production history of that and other advanced wartime rocket engines.

Since the range is inversely proportional to the molecular weight of the exhaust molecules, changing the fuel from ethanol or hydrocarbons to liquid hydrogen would reduce the average molecular weight from M.W. $\approx$ 27 (a mixture of roughly 1/3 CO_2 and roughly 2/3 H_2O) to M.W. = 12 (H_2O with some H_2, if a fuel-rich propellant mix is used) while keeping the combustion chamber temperature the same (2200^{o}K) would increase the range by a factor of

$$\frac{27}{12} \approx 2.25 , \tag{E.66}$$

or approximately 125%. For example, the maximum range of the A-4 would increase from approximately 350 km to approximately 788 km.

Both changing the fuel from ethanol to liquid hydrogen and increasing the combustion chamber temperature from 2200^{o}K to 3500^{o}K would increase the range by a factor of

$$\frac{3500^o\mathrm{K}}{2200^o\mathrm{K}} \, \frac{27}{12} \approx 3.58 , \tag{E.67}$$

or approximately 258%. For example, the maximum range of the A-4 would increase from approximately 350 km to approximately 1250 km.

Although liquid hydrogen is even more cumbersome than liquid oxygen, using it would yield a huge increase in range, whether or not the combustion chamber temperature could be increased. For this reason, there would have been very strong incentive for the German rocket program to pursue liquid hydrogen fuel. In fact, there is some evidence that it did so:

a. A 1944 prisoner of war report stated that German rockets using hydrogen fuel had been successfully tested (p. 5311).

b. A November 1945 conference presentation reporting details of postwar Allied investigations of the German rocket program mentions hydrogen fuel (p. 5448).

c. A 1946 U.S. intelligence report mentions wartime German hydrogen and oxygen production plants in conjunction with the report of V-2 and A-9 rocket programs that were taken over by Soviet forces (p. 5537).

d. Walter Dornberger mentioned wartime interest in liquid hydrogen to increase the performance of the A-4 (p. 5537).

e. Krafft Ehricke mentioned wartime research on liquid hydrogen for rockets (p. 5764).

f. Is there other evidence?

E.7.4 Adding a Booster Stage to the Rocket

Another solution to increase the rocket performance was to use two or more stages, such that the structural mass of each stage could be jettisoned once all of the propellant in that stage had been consumed. This solution is very effective and therefore widely used in modern launch vehicles, but it is also fairly complex as it requires the development and perfection of a larger and entirely new rocket engine and stage to serve as the first-stage booster of a smaller rocket.

In the wartime German rocket program, the best-known example of this approach was the A-9/A-10 two-stage rocket; Table E.5 gives approximate specifications for the A-9 and A-10 stages. The Silbervogel space plane may also be viewed as a two-stage system, in which the rocket-powered catapult booster sled was effectively the first stage and the rocket plane itself was the second stage. Table E.6 gives approximate specifications for that system. Exact values for the A-9/A-10 and Silbervogel specifications vary among different sources in the literature and for different versions of these systems[8], but the approximate values given in these tables are sufficient to estimate the performance of each system.

Characteristic	**Symbol**	**Approximate value**
Payload mass	m_{payload}	2000 kg
A-9 empty mass	m_{A9}	3000 kg
A-9 propellant mass	$m_{\text{A9 propellant}}$	12,000 kg
A-9 total initial mass	$(m_{\text{initial}})_2 = m_{\text{payload}} + m_{\text{A9}} + m_{\text{A9 propellant}}$	17,000 kg
A-9 total final mass	$(m_{\text{final}})_2 = m_{\text{payload}} + m_{\text{A9}}$	5000 kg
A-9 effective exhaust velocity	$(v_{\text{exh}})_2$	2000 m/sec
A-9 burn time	t_2	95 sec
A-9 thrust	$(F_{\text{thrust}})_2$	3×10^5 N
A-10 empty mass	m_{A10}	17,000 kg
A-10 propellant mass	$m_{\text{A10 propellant}}$	52,000 kg
A-9/A-10 total initial mass	$(m_{\text{initial}})_1 = m_{\text{payload}} + m_{\text{A9}} + m_{\text{A9 propellant}} + m_{\text{A10}} + m_{\text{A10 propellant}}$	86,000 kg
A-9/A-10 total final mass	$(m_{\text{final}})_1 = m_{\text{payload}} + m_{\text{A9}} + m_{\text{A9 propellant}} + m_{\text{A10}}$	34,000 kg
A-10 effective exhaust velocity	$(v_{\text{exh}})_1$	2000 m/sec
A-10 burn time	t_1	50 sec
A-10 thrust	$(F_{\text{thrust}})_1$	2×10^6 N

Table E.5: Specifications for estimating performance of A-9/A-10 rocket.

Booster sled Δv	$(\Delta v)_1$	500 m/sec
Booster sled burn time	t_1	11 sec
Booster sled thrust	$(F_{\text{thrust}})_1$	?? N

Table E.6: Specifications for estimating performance of Silbervogel space plane.

Using the A-9/A-10 rocket specifications from Table E.5 in Eq. (E.32), the A-9/A-10 had a maximum velocity $\Delta v \approx 4300$ m/sec. Assuming $\sim$ 10% loss for aerodynamic drag and gravitational losses, the effective maximum velocity was

$$(\Delta v)_{\mathrm{A9/A10}} \approx 3870 \text{ m/sec} \tag{E.68}$$

Using Eq. (E.68) in Eqs. (E.47), (E.50), and (E.52), the maximum altitude, flight time, and range of the A-9/A-10 rocket during its ballistic trajectory (not counting the subsequent gliding reentry using its wings) were:

$$(\Delta H)_{\mathrm{A9/A10}} \approx 380 \text{ km} \tag{E.69}$$

$$(\Delta t_{\mathrm{ballistic}})_{\mathrm{A9/A10}} \approx 9.3 \text{ min} \tag{E.70}$$

$$(\Delta x_{\mathrm{ballistic}})_{\mathrm{A9/A10}} \approx 1500 \text{ km} \tag{E.71}$$

Note that this maximum altitude and range agree very well with the early (ballistic) part of the A-9/A-10 trajectory shown in Heinz Stoelzel's diagram in Fig. E.96. This does not include the additional range from using the A-9's wings to follow a gliding trajectory after the ballistic trajectory; that effect will be calculated shortly.

Using the Silbervogel space plane/booster sled specifications from Table E.6 in Eq. (E.32), the two-stage Silbervogel system had a maximum velocity $\Delta v \approx 6860$ m/sec. Assuming $\sim$ 10% loss for aerodynamic drag and gravitational losses, the effective maximum velocity was

$$(\Delta v)_{\mathrm{Silbervogel}} \approx 6170 \text{ m/sec} \tag{E.72}$$

Using Eq. (E.72) in Eqs. (E.47), (E.50), and (E.52), the maximum altitude, flight time, and range of the Silbervogel during its ballistic trajectory (not counting the subsequent skip and/or gliding trajectories using its wings) were:

$$(\Delta H)_{\mathrm{Silbervogel}} \approx 970 \text{ km} \tag{E.73}$$

$$(\Delta t_{\mathrm{ballistic}})_{\mathrm{Silbervogel}} \approx 15 \text{ min} \tag{E.74}$$

$$(\Delta x_{\mathrm{ballistic}})_{\mathrm{Silbervogel}} \approx 3900 \text{ km} \tag{E.75}$$

The effect of the Silbervogel's wings will be calculated shortly.

E.7.5 Adding Strap-on Boosters to the Rocket

Strap-on boosters could also improve the performance of rocket such as the A-4, just as they have been used to improve the performance of many modern launch vehicles such as the U.S. Space Shuttle, Titan, and Delta. Do any reports give the empty mass, propellant mass, exhaust velocity, burn time, and thrust of suitable strap-on boosters? If so, one can calculate how much they would improve the performance of an A-4, A-9, or other rocket.

E.7.6 Adding Wings to the Rocket

Wings would enable a rocket to execute a long gliding reentry into the atmosphere instead of a steep ballistic reentry, so that a rocket of the same size would have greatly extended range. This solution was being pursued with the winged A-9 and Silbervogel space plane, but it was more complex due to the large aerodynamic and heating loads on the reentering vehicle and the need for real-time onboard or remote human guidance during the tricky reentry phase to reach the intended target.

From Eq. (E.61), using wings to add a glide trajectory after a ballistic trajectory increases the total range by a factor of $[1+(L/2D)]$. It also increases the total flight time by factor of $[1+(L/\sqrt{2}D)]$.

Assuming a lift-to-drag ratio of $L/D \approx 5$, adding wings to a standard A-4 with a range of 350 km and a flight time of 4.5 min would produce an A-4b (or A-9) with a range and flight time of

$$(\Delta x_{\text{ballistic+glide}})_{\text{A4b}} \approx 1200 \text{ km} \tag{E.76}$$

$$(\Delta t_{\text{ballistic+glide}})_{\text{A4b}} \approx 20 \text{ min} \tag{E.77}$$

For this same lift-to-drag ratio of $L/D \approx 5$, adding wings to an A-9/A-10 with a range of 1500 km and a flight time of 9.3 min would yield a total range and flight time of

$$(\Delta x_{\text{ballistic+glide}})_{\text{A9/A10}} \approx 5300 \text{ km} \tag{E.78}$$

$$(\Delta t_{\text{ballistic+glide}})_{\text{A9/A10}} \approx 42 \text{ min} \tag{E.79}$$

Note that these ranges agree very well with those for the winged A-9 or A-9/A-10 trajectories shown in Heinz Stoelzel's diagram in Fig. E.96.

Assuming a lift-to-drag ratio of $L/D \approx 6.5$ for the Silbervogel, adding a glide (but no skips) would extend its purely ballistic range of 3900 km and flight time of 15 min to a total range and flight time of

$$(\Delta x_{\text{ballistic+glide}})_{\text{Silbervogel}} \approx 17{,}000 \text{ km} \tag{E.80}$$

$$(\Delta t_{\text{ballistic+glide}})_{\text{Silbervogel}} \approx 84 \text{ min} \tag{E.81}$$

Adding skips would extend the Silbervogel's range and flight time even further. The detailed effects of the skips are difficult to calculate precisely but will be addressed in Section E.7.7.

In general, the A-9/A-10 and Silbervogel plane/sled systems had many similarities. Both were two-stage rockets that launched a winged space plane on an intercontinental trajectory involving both ballistic and glide phases. However, Silbervogel was approximately 6 times larger than A-9 (100,000 kg vs. 17,000 kg), and over 50% faster, with a much more advanced trajectory (repeated skips) and more serious reentry stress and heating requirements. Even if experimental work did not get as far on it as the experimental work for the A-9/A-10, the Silbervogel was an incredibly advanced design for its time and the true predecessor of the U.S. Space Shuttle and other space planes. Its planned skip trajectory led to the double-dip reentry trajectory for returning missions from beyond Earth orbit, as will be discussed in Section E.7.7.

E.7.7 Decreasing Stresses During Atmospheric Reentry

Very simple mathematical models of reentry performance may be derived from first principles, and then applied to estimate the reentry deceleration, heating, and range of the A-4, A-9, and Silbervogel and show how they would compare to the reentry performance of modern ballistic missiles and spacecraft.

General considerations

The typical velocity of vehicles reentering the atmosphere from orbit may be found by considering a vehicle of mass m in a circular orbit just above the earth's atmosphere, say at a height $H = 150$ km above the earth's surface. Because H is much smaller than the radius of the earth $R_\oplus \approx 6380$ km, one may simply use $R_\oplus$ for the orbital radius and the surface value $g \approx 9.807$ m/sec^2 for the gravitational acceleration. In a circular orbit at velocity v_o, viewed in a rotating reference frame, the outward centrifugal force $mv_o^2/R_\oplus$ balances the inward gravitational force mg:

$$\frac{mv_o^2}{R_\oplus} = mg \ , \ \text{or} \tag{E.82}$$

$$v_o = \sqrt{gR_\oplus} \approx 7.91 \ \text{km/sec} \approx \text{Mach} \ 23 \tag{E.83}$$

At this speed, each kg of the vehicle has a kinetic energy 1 kg $\cdot \, v_o^2/2 \approx 3.13 \times 10^7$ J that is equivalent to the explosive energy of roughly 7 kg of TNT–the vehicle's energy is equivalent to seven times its mass in high explosives. This enormous kinetic energy must be safely dissipated before the vehicle reaches the earth's surface. A rocket could slow an orbiting vehicle to a stop, but such a decelerating rocket would need to be as large as the one that initially accelerated the vehicle to orbital speed, and then sending the decelerating rocket into orbit would require an unimaginably large initial launch vehicle.

The simplest solution is to use aerodynamic drag in the atmosphere to steadily dissipate a vehicle's kinetic energy before it lands. However, the reentry trajectory must be chosen so that both:

1. Deceleration of the vehicle is not too severe for the instrumentation or the passengers (if there are any). The deceleration must be prolonged over at least a few minutes to limit it to levels that can be tolerated by humans. At the upper limit of human endurance, a $\sim 10g \sim 100$ m/sec^2 deceleration would require 80 seconds to brake an initial velocity of 8000 m/sec, and a more readily tolerated $\sim 3g \sim 30$ m/sec^2 deceleration would require ~ 4.5 minutes.

2. Heating of the vehicle from aerodynamic drag is not too great. The kinetic energy ~ 30 MJ/kg that must be dissipated is 2-4 times larger than the energy required to vaporize most materials. Methods for safely dissipating this much energy without vaporizing the vehicle will now be discussed.

When air flow impacts a reentering vehicle, the kinetic energy density $\rho v^2/2$ of the flow relative to the vehicle is converted to thermal energy density $\rho c_p T$, heating the air to a temperature T far higher than the ambient air temperature. As the temperature rises, air molecules first are excited into higher energy states, then dissociate into individual atoms, and then finally are progressively stripped of their electrons and ionized. While the specific heat capacity at constant pressure c_p is a constant for air at lower temperatures, at higher temperatures c_p is a function of temperature, to account for these various effects. Air is mostly nitrogen, and monatomic nitrogen would have $c_p \approx 717.5$ J/(kg ^{o}K). As the nitrogen atoms are excited and partially ionized, they gain more degrees of freedom (the electrons can be in various energy levels), so c_p increases. The extent of excitation and ionization and hence the value of c_p vary over the temperature range characteristic of reentry, but in general a good value to use for Earth reentry is:

$$c_p \approx 5000 \ \frac{\mathrm{J}}{\mathrm{kg\ ^oK}} \tag{E.84}$$

A vehicle reentering at velocity v heats the flow directly impacting it (converting virtually all of the kinetic energy $\frac{1}{2}mv^2$ to thermal energy mc_pT, where m is the mass of the air) to a stagnation temperature of

$$T \approx \frac{v^2}{2c_p} \approx 10^{-4}\, v^2_{\mathrm{m/sec}} \ \ ^{\mathrm{o}}\mathrm{K} \tag{E.85}$$

For a vehicle with orbital velocity $v \sim 8000$ m/sec, the stagnation temperature is $T \sim 6400^o$K. This is high enough to melt or vaporize virtually all materials, and is even hotter than the surface of the sun, which is approximately 5800^{o}K.

Since the drag force per cross-sectional area of a vehicle is $C_D\rho v^2/2$ and power is the product of force and velocity, the rate at which a reentering vehicle's kinetic energy is converted to heat is $C_D\rho v^3/2$. Using a coefficient of drag $C_D \approx 2$ for a blunt hypersonic vehicle, the heat production rate is

$$q_{\mathrm{total}} \approx \rho\, v^3 \ \frac{\mathrm{W}}{\mathrm{m}^2} \tag{E.86}$$

For a typical high-altitude atmospheric density $\rho \sim 10^{-4}$ kg/m^3 and vehicle velocity $v \sim 8000$ m/sec, the total heat production rate is an incredible $q_{\mathrm{total}} \sim 50$ MW/m^2.

Fortunately, for a well-designed vehicle, only a small fraction of this heat is transferred to the vehicle, and the rest is imparted to the surrounding air. Ideally a reentry vehicle should have blunt instead of sharp leading surfaces, in order to minimize heating of the vehicle. At hypersonic speeds, a streamlined vehicle creates a weaker shock wave and heats the air less, but the vehicle absorbs much more of the heat that is generated, since the shock and boundary layers are so close to the vehicle, especially where the shock wave is attached at the vehicle's nose. (For such a streamlined design, reentry would first melt the nose, and then proceed to destroy the rest of the vehicle.) In contrast, a very blunt vehicle creates a stronger shock wave and heats the air more, but the vehicle absorbs much less of the heat that is generated, since the shock wave is detached from the vehicle, and the intervening boundary layer serves to insulate the vehicle from most of the heat. Thus modern reentry capsules have broad, flattened heat shields facing the oncoming flow, and modern space-shuttle-type reentry vehicles have blunt noses and rounded leading wing edges and also reenter at a high angle of attack with the flat underside facing the oncoming flow.

At the velocities that will be considered in this section, convection is the dominant mode of heat transfer, although at higher velocities, radiative heat transfer would also need to be considered. The heat transferred from a medium at temperature T_∞ through a boundary layer of thickness δ and thermal conductivity κ to a vehicle of surface temperature T_s and radius R is

$$q_{\mathrm{vehicle}} \approx \frac{\kappa(T_\infty - T_s)}{\delta(R)} \tag{E.87}$$

The laminar boundary layer thickness for a vehicle of size R is $\delta \sim R/\sqrt{\mathrm{Re}_R}$, where Re_R is the Reynolds number, so the heat transfer is

$$q_{\text{vehicle}} \;\sim\; \sqrt{\mathrm{Re}_R}\,\frac{\kappa(T_\infty - T_s)}{R} \tag{E.88}$$

Empirical measurements yield the best numerical factor for heat transfer to a sphere:

$$q_{\text{vehicle}} \;\approx\; 2\,\sqrt{\mathrm{Re}_R}\,\frac{\kappa(T_\infty - T_s)}{R} \tag{E.89}$$

Assuming that the air temperature just beyond the boundary layer is the stagnation temperature $T_\infty = v^2/(2c_p)$, that the stagnation temperature is much higher than the vehicle temperature ($T_\infty \gg T_s$), and that the Reynolds number is $\mathrm{Re}_R = \rho v R/\mu$, Eq. (E.89) becomes

$$q_{\text{vehicle}} \;\approx\; \frac{\kappa/c_p}{\sqrt{\mu}}\sqrt{\frac{\rho}{R}}\,v^{2.5} \;\approx\; \sqrt{\mu}\,\sqrt{\frac{\rho}{R}}\,v^{2.5} \tag{E.90}$$

in which Eq. (E.90) used the relation $\mu \approx \kappa/c_p$ from the Prandtl number for air, $\mathrm{Pr} = c_p\mu/\kappa \approx 1$.

The viscosity of air varies with temperature according to Sutherland's law. Assuming $\mu_0 \approx 1.72 \times 10^{-5}$ Pa·sec and $T_0 \approx 273^o$K, neglecting S in comparison to the temperatures, and using Eq. (E.85), the viscosity may be expressed as:

$$\mu \;\approx\; 1.0 \times 10^{-6}\,\sqrt{T_{^oK}}\;\frac{\text{kg}}{\text{m sec}} \;\approx\; 1.0 \times 10^{-8}\,v_{\text{m/sec}}\;\frac{\text{kg}}{\text{m sec}} \tag{E.91}$$

Combining Eqs. (E.90) and (E.91), the heat transfer becomes

$$q_{\text{vehicle}} \;\approx\; 1 \times 10^{-4}\sqrt{\frac{\rho}{R}}\,v^3\;\frac{\text{W}}{\text{m}^2} \tag{E.92}$$

Of course, a reentering vehicle is generally not spherical, and the precise local and total heat transfer rates will depend on the specific shape of the vehicle. However, Eq. (E.92) is extremely useful for obtaining initial estimates of reentry heat transfer before doing more detailed calculations.

Taking the ratios of Eqs. (E.92) and (E.86), the fraction of the heat transferred to the vehicle is

$$\frac{q_{\text{vehicle}}}{q_{\text{total}}} \;\approx\; 10^{-4}\,\frac{1}{\sqrt{\rho R}} \tag{E.93}$$

For ballpark values of high-altitude atmospheric density $\rho \sim 10^{-4}$ kg/m^3 and reentry capsule size $R \sim 1$ m, the ratio is $q_{\text{vehicle}}/q_{\text{total}} \sim 10^{-2}$. Thus only $\sim 1\%$ of the produced heat is imparted to the vehicle, but that is still a very considerable ~ 0.5 MW/m^2. Likewise, the boundary layer insulates the vehicle from the $\sim 6000^o$K stagnation temperature of the airflow, although heat transfer across the boundary layer can still heat the leading surfaces of the vehicle to 1000–2000^{o}K.

To protect the vehicle, these leading surfaces are covered by a heat shield. The underside of the U.S. Space Shuttle was covered with low-density tiles made of silica fibers (the tiles had a net density only $\sim 6\%$ that of solid silica, the remainder of the volume being empty space to minimize thermal conductivity) covered with black borosilicate paint, and the shuttle's nose and leading wing edges had tiles of carbon-carbon composite (graphite fibers for strength embedded in amorphous carbon for lower thermal conductivity than carbon lattices) better able to withstand the higher temperatures in those locations. Because these tiles were very good thermal radiators and insulators, they reradiated most of the heat they acquired back to the airflow, and conducted very little of the heat to the rest of the shuttle. Most other reentry vehicles are single-use and employ ablative heat shields that are gradually vaporized during reentry in order to remove the thermal energy they have absorbed before it can be conducted to the rest of the vehicle. For example, each U.S. Apollo command module used a fiberglass heat shield that was initially $\sim 25\%$ silica fibers and $\sim 75\%$ epoxy resin; after reentry most of the silica fibers remained, but the epoxy resin had been charred until only carbon remained from its initial composition.

Since the power dissipated by atmospheric deceleration is $\sim \rho v^3$, to limit deceleration and heating to tolerable levels, it is important to choose reentry trajectories that remain as high as possible (to minimize ρ) while the velocity v is still very large. Reentry trajectories suitable for different types of missions are shown in Fig. E.270: (a) ballistic reentry, (b) lifting reentry, (c) skip reentry, and (d) double-dip reentry.

The atmospheric density decays exponentially with increasing altitude, starting from the sea level value $\rho_o \approx 1.225$ kg/m^3. Physically, higher air weighs on lower air, making it more dense, and all of that weighs even more on air below that, making the density vary exponentially:

$$\rho = \rho_o \, e^{-H/H_o} \tag{E.94}$$

$$\text{where } H_o \equiv \frac{RT}{g} \approx 29.3 \, T_{^o\mathrm{K}} \text{ m} \qquad \text{Atmospheric scale height} \tag{E.95}$$

The stratosphere is the most important layer of the atmosphere for reentry. For the temperature $T \approx 220$ ^{o}K typical of the stratosphere, the scale height is $H_o \approx 6.5$ km.

A vehicle of cross-sectional area A experiences aerodynamic drag D and lift L forces:

$$D = \frac{1}{2} C_D A \rho v^2 \tag{E.96}$$

$$L = \frac{1}{2} C_L A \rho v^2 \tag{E.97}$$

where the drag and lift coefficients C_D and C_L are assumed to be constant for simplicity.

Although centrifugal force is considered (in a rotating frame of reference that effectively follows the vehicle around the earth), curvature of the Earth with respect to the flight path is generally neglected in the following calculations.

To convert the equations of motion into an easily solvable form, reentry calculations commonly change the independent variable in differential equations by taking the ratio of derivatives, as will be shown.

Figure E.270: Atmospheric reentry approaches include ballistic reentry, lifting-body reentry, skip reentry, and double-dip reentry.

A. Ballistic reentry

In a ballistic reentry (Fig. E.270), the vehicle cannot generate aerodynamic lift; this applies to many warheads and the Vostok and Mercury space capsules. The effective gravitational acceleration, the difference between the downward gravitational acceleration and the upward centrifugal acceleration, is between 0 and 1 g. (0 g would be a circular orbit with the gravitational and centrifugal forces balanced, and 1 g would be falling with no forward velocity.) As will be shown, the vehicle deceleration due to aerodynamic drag is far larger than this, so gravity and centrifugal force may be neglected. The vehicle's initial velocity v_i is typically of the order of v_o from Eq. (E.83). The pitch angle θ between the trajectory and the local horizontal is defined to be negative when downward; for simplicity it is assumed to be constant. Using Eq. (E.96), Newton's second law for the acceleration a along the trajectory is

$$a \;=\; \frac{dv}{dt} \;=\; -\,\frac{1}{2m}\,C_D A\rho v^2 \tag{E.98}$$

Taking the ratio of $d\rho/dH = -\rho/H_o$ [using Eq. (E.94)] and $dH/dt = -v\,|\sin\theta|$, one finds:

$$\frac{d\rho}{dt} \;=\; \frac{d\rho}{dH}\,\frac{dH}{dt} \;=\; \frac{\rho v}{H_o}\;|\sin\theta| \tag{E.99}$$

Equation (E.99) may be used to rewrite Eq. (E.98), changing the independent variable from t to ρ:

$$\frac{dv}{d\rho} \;=\; \frac{dv/dt}{d\rho/dt} \;=\; -\,\frac{C_D A H_o}{2m\,|\sin\theta|}\;v \tag{E.100}$$

Equation (E.100) is simply an equation for exponential decay, so its solution is

$$v \;=\; v_i\,\exp\left(-\,\frac{C_D A H_o}{2m\,|\sin\theta|}\;\rho\right) \tag{E.101}$$

$$\;=\; v_i\,\exp\left(-\,\frac{C_D A H_o \rho_o}{2m\,|\sin\theta|}\;e^{-H/H_o}\right) \tag{E.102}$$

Inserting Eq. (E.101) into Eq. (E.98) yields the acceleration as a function of the local density:

$$a \;=\; -\,\frac{C_D A\rho v_i^2}{2m}\,\exp\left(-\,\frac{C_D A H_o \rho}{m\,|\sin\theta|}\right) \tag{E.103}$$

Setting $d/d\rho$ of Eq. (E.103) equal to zero, one finds the density at which maximum deceleration occurs:

$$\frac{da}{d\rho} \;=\; -\,\frac{C_D A v_i^2}{2m}\,\exp\left(-\,\frac{C_D A H_o \rho}{m\,|\sin\theta|}\right)\left(1\;-\;\frac{C_D A H_o \rho}{m\,|\sin\theta|}\right) \;=\; 0$$

$$\Longrightarrow\;\; \rho_{\text{max decel}} \;=\; \frac{m\,|\sin\theta|}{C_D A H_o} \tag{E.104}$$

Inserting Eq. (E.104) into (E.101) and (E.94) gives the velocity and altitude for the maximum deceleration:

$$v_{\text{max decel}} \;=\; e^{-1/2}\, v_i \;\approx\; 0.607\, v_i \tag{E.105}$$

$$H_{\text{max decel}} \;=\; H_o \ln\left(\frac{\rho_o}{\rho_{\text{max decel}}}\right) \;=\; H_o \ln\left(\frac{C_D A H_o \rho_o}{m\,|\sin\theta|}\right) \tag{E.106}$$

Note that for an object with a sufficiently large mass and small cross section for drag ($m/A \to \infty$), atmospheric drag does not slow an object much, and Eq. (E.106) predicts that maximum deceleration would not occur until a theoretical negative altitude, whereas of course the solid ground (not included in the equation) intervenes to cause maximum deceleration at $H = 0$. The reentry and impact of a large, dense meteorite would be a good example.

Plugging Eq. (E.104) into Eq. (E.103) gives the maximum deceleration:

$$\begin{aligned} |a|_{\text{max decel}} \;&=\; \frac{v_i^2\,|\sin\theta|}{2H_o e} \;=\; \frac{R_\oplus}{2H_o e}\;|\sin\theta|\left(\frac{v_i}{v_o}\right)^2\;\text{g} \\ &\approx\; 180\;|\sin\theta|\left(\frac{v_i}{v_o}\right)^2\;\text{g} \end{aligned} \tag{E.107}$$

From Eq. (E.107), the maximum deceleration is independent of the vehicle drag coefficient. For a given reentry angle, vehicles with different values of C_D experience the same maximum deceleration, though higher-drag vehicles experience it at a higher altitude, according to Eq. (E.106).

The deceleration can be over 100 g for $v_i \sim v_o$ and large reentry angles θ. This justifies the original assumption that the effective gravitational acceleration could be neglected. If the reentry angle could be made arbitrarily small, Eq. (E.107) shows that the deceleration would approach zero. Unfortunately, even in a ballistic reentry into the atmosphere from a circular orbit with $v_i = v_o$, the decelerating vehicle will begin to lose altitude as its decreasing upward centrifugal acceleration fails to balance the downward gravitational acceleration, so there is a minimum achievable value of θ and hence a minimum achievable value for the peak deceleration. At the point of maximum deceleration, this difference between the gravitational and centrifugal forces produces a net downward effective gravitational acceleration of

$$|g_{\text{effective}}|_{\text{max decel}} \;=\; g \;-\; \frac{(v_o/\sqrt{e})^2}{R_\oplus} \;=\; \frac{e-1}{e}\,g \tag{E.108}$$

Assuming that θ is small, the vehicle's horizontal velocity at the point of maximum deceleration is approximately

$$\frac{v_o}{\sqrt{e}} \;=\; v_o - |a|_{\text{avg}}\,\Delta t \tag{E.109}$$

$$\Longrightarrow\; \Delta t \;=\; \frac{v_o}{|a|_{\text{avg}}}\,\frac{\sqrt{e}-1}{\sqrt{e}}\;, \tag{E.110}$$

in which Δt is the time between the beginning of reentry and the point of maximum deceleration, and $|a|_{\text{avg}}$ is the average deceleration during that time.

Similarly, for small θ the downward vertical velocity at the point of maximum deceleration is approximately

$$\frac{v_o}{\sqrt{e}}\,\theta \;=\; |g_{\text{effective}}|_{\text{avg}}\;\Delta t \tag{E.111}$$

$$\Longrightarrow\;\theta \;=\; (\sqrt{e}-1)\,\frac{|g_{\text{effective}}|_{\text{avg}}}{|a|_{\text{avg}}} \tag{E.112}$$

$$\approx\; (\sqrt{e}-1)\,\frac{|g_{\text{effective}}|_{\text{max decel}}}{|a|_{\text{max decel}}}\;, \tag{E.113}$$

which may be used to find the minimum achievable ballistic reentry angle.

Inserting Eqs. (E.115) and (E.107) into Eq. (E.113) and solving for θ yields

$$\theta \;=\; \left[\frac{(\sqrt{e}-1)(e-1)}{180e}\right]^{1/2} \;\approx\; 0.0477\text{ radians}\quad(\text{or }\;2.73^{o}) \tag{E.114}$$

$$|a|_{\text{max decel}} \;=\; 180\theta\text{ g} \;\approx\; 8.6\text{ g} \tag{E.115}$$

The Soviet Vostok and U.S. Mercury capsules executed a shallow-angle ballistic reentry and hence experienced $\sim 8-9$ g of deceleration, at the upper limit of what their pilots could tolerate. Reducing $|a|_{\text{max}}$ below this value requires aerodynamic lift, so that the spacecraft can remain longer at very high altitudes, where the air is less dense and the aerodynamic drag less severe.

For a Vostok or Mercury reentry with typical values $H_o \approx 6500$ m, $C_D \approx 2$, $A \sim 3$ m^2, $\rho_o \approx 1.225$ kg/m^3, $m \sim 2000$ kg, and $\theta \approx 0.0477$, Eqs. (E.104) and (E.106) indicate that maximum deceleration for a capsule reentering from circular orbit occurs at an atmospheric density $\rho_{\text{max decel}} \approx 2\times10^{-3}$ kg/m^3 and an altitude $H_{\text{max decel}} \approx 40$ km.

Inserting Eq. (E.101) into Eq. (E.92), the heat transfer rate to the vehicle during ballistic reentry is

$$q_{\text{vehicle}} \;\approx\; 1\times10^{-4}\,v_i^3\sqrt{\frac{\rho}{R}}\;\exp\left(-\,\frac{3C_DAH_o}{2m\,|\sin\theta|}\,\rho\right)\;\frac{\text{W}}{\text{m}^2} \tag{E.116}$$

Using Eq. (E.116) and setting $dq_{\text{vehicle}}/d\rho = 0$, one finds that the maximum heat transfer occurs when the atmospheric pressure is

$$\rho_{\text{max heat}} \;=\; \frac{m\,|\sin\theta|}{3C_DAH_o} \;=\; \frac{1}{3}\,\rho_{\text{max decel}}\;, \tag{E.117}$$

or $\rho_{\text{max heat}} \sim 7\times10^{-4}$ kg/m^3 for the Vostok/Mercury case.

Inserting Eq. (E.117) into Eq. (E.116) gives the maximum heat transfer:

$$q_{\text{vehicle, max}} \quad \approx \quad 1 \times 10^{-4}\, v_i^3 \sqrt{\frac{m\,|\sin\theta|}{3eC_D A H_o R}}\ \frac{\text{W}}{\text{m}^2} \tag{E.118}$$

For a Vostok or Mercury capsule with $v_i = v_o \approx 8000$ m/sec, $m \sim 2000$ kg, $\theta \sim 0.0477$, $C_D \approx 2$, $A \sim 3$ m^2, $H_o \approx 6500$ m, and $R \sim 1$ m, the maximum heat transfer is $q_{\text{vehicle, max}} \sim 1$ MW/m^2. As predicted by Eqs. (E.86) and (E.93), this is indeed only a small fraction of the total generated heat, although it is still a large number and required a very good ablative heat shield.

On the other hand, a reentering A-4 (or a warhead or capsule separated from an A-4, if that were done) would have a much lower initial velocity than the Vostok and Mercury capsules, since it would not be coming from orbit. From Table E.4, a typical value for the A-4 would have been more like $v_i \approx 1750$ m/sec, or around 0.22 of orbital velocity (8000 m/sec). Assuming for simplicity that all other parameters were roughly the same, Eq. (E.118) shows that the maximum heat transfer to the A-4 would have been roughly $(1750/8000)^3 \approx 0.01$ times as large as that for reentering orbital capsules, or $q_{\text{vehicle, max}} \sim 10$ kW/m^2, a much more manageable number. Of course, that is the peak heat transfer on a reentry trajectory designed to be as shallow as possible in order to minimize the deceleration and heating. An A-4 on a steeper reentry trajectory would experience greater heating.

Inserting Eq. (E.117) into Eq. (E.101) and (E.94) gives the velocity and altitude for the maximum heating:

$$v_{\text{max heat}} \quad = \quad e^{-1/6}\, v_i \ \approx\ 0.846\, v_i \tag{E.119}$$

$$H_{\text{max heat}} \quad = \quad H_o \ln\left(\frac{\rho_o}{\rho_{\text{max heat}}}\right) \ = \ H_o \ln\left(\frac{3C_D A H_o \rho_o}{m\,|\sin\theta|}\right) \tag{E.120}$$

$$= \quad H_o \ln\left(\frac{3C_D A H_o \rho_o}{m\,|\sin\theta|}\right) + H_o \ln 3 \ \approx\ H_{\text{max decel}} + 1.10 H_o \tag{E.121}$$

Thus the point of maximum heating occurs earlier during reentry than the point of maximum deceleration, or when the vehicle is approximately 1.1 $H_o \approx 7$ km higher.

B. Lifting-body reentry

Lifting reentry (Fig. E.270) covers the case in which the vehicle generates aerodynamic lift as well as drag. For simplicity, the ratio of the lift and drag forces from Eqs. (E.97) and (E.96), $L/D = C_L/C_D$, is assumed to remain constant during the reentry, and the initial velocity is assumed to be the orbital velocity v_o from Eq. (E.83). Because very small angles minimize the deceleration (as shown for ballistic reentry) and the vehicle now has lift to help support it, one can assume that the trajectory is essentially horizontal.

Neglecting vertical acceleration, the downward gravitational and upward centrifugal and lift forces must balance:

$$mg = \frac{mv^2}{R_\oplus} + L \tag{E.122}$$

Using Eq. (E.97) for L in Eq. (E.122) and solving for the velocity v yields:

$$mg = \frac{mv^2}{R_\oplus} + \frac{1}{2} C_L A \rho v^2 \tag{E.123}$$

$$\Longrightarrow v = \frac{v_o}{\sqrt{1 + \frac{R_\oplus C_L A \rho}{2m}}} = \frac{v_o}{\sqrt{1 + \frac{R_\oplus C_L A \rho_o}{2m}\, e^{-H/H_o}}} \tag{E.124}$$

$$\approx \sqrt{\frac{2mg}{C_L A \rho_o}}\, e^{H/2H_o} \tag{E.125}$$

The approximation in the last step is valid once the velocity is low enough that the centrifugal force is much smaller than the lift.

Equation (E.122) may be turned around into a form that will be useful in a moment:

$$\frac{1}{m} = \frac{g}{L}\left[1 - \left(\frac{v}{v_o}\right)^2\right] \tag{E.126}$$

Newton's second law along the trajectory is:

$$\frac{dv}{dt} = -\frac{D}{m} \tag{E.127}$$

Substituting Eq. (E.126) into Eq. (E.127), one finds the acceleration:

$$\frac{dv}{dt} = -g\,\frac{D}{L}\left[1 - \left(\frac{v}{v_o}\right)^2\right] \tag{E.128}$$

Thus the magnitude of the deceleration increases as the velocity v decreases, asymptotically approaching gD/L:

$$|a|_{\text{max decel}} \;=\; \frac{D}{L}\;\;\text{g} \tag{E.129}$$

The Gemini, Apollo, and Soyuz capsules had a lift-to-drag ratio $L/D \approx 0.5$, giving a maximum deceleration ~ 2 g, much better than the earlier Mercury and Vostok. The U.S. Space Shuttle's lift-to-drag ratio was $L/D \approx 2.5$, so its peak deceleration was even more gentle, ~ 0.4 g. A-9 would have had $L/D \approx 5$, or a ~ 0.2 g peak deceleration. Silbervogel would have had $L/D \approx 6.5$, or a ~ 0.15 g peak deceleration during the gliding portion of its terminal trajectory. (Silbervogel would have experienced brief periods of greater acceleration during its skips off the atmosphere before that; see p. 5818.)

The reentry trajectory of a lifting body actually deviates from the horizontal by a small negative (downward) angle θ, which may be found from the relation:

$$\sin\theta \;=\; \frac{1}{v}\,\frac{dH}{dt} \;=\; \frac{1}{v}\,\frac{dv/dt}{dv/dH} \tag{E.130}$$

Taking the derivative d/dH of both sides of Eq. (E.125) produces

$$\frac{dv}{dH} \;=\; \frac{Lv}{2mgH_o} \tag{E.131}$$

Inserting Eqs. (E.127) and (E.131) into Eq. (E.130), one finds:

$$\sin\theta \;=\; 2\,\frac{D}{L}\,\frac{H_o g}{v^2} \tag{E.132}$$

Equation (E.132) shows that the magnitude of θ increases (the vehicle drops more rapidly) as the velocity v decreases, since there is less centrifugal force and lift to keep the vehicle aloft.

θ is small enough that the approximation $\sin\theta \approx \theta$ is valid. Using a mid-reentry value of the velocity, $v \sim v_o/2$, yields an estimate of θ during reentry:

$$\theta \;\sim\; 8\,\frac{D}{L}\,\frac{H_o}{R_\oplus} \;\approx\; \frac{D}{L}\,0.5\,^o\,, \tag{E.133}$$

validating the initial assumption of nearly horizontal flight.

The ground range Δx travelled during reentry may be estimated from θ and the altitude drop during that time, say $\Delta H \sim 2H_o$:

$$\Delta x \;\;\sim\;\; \frac{\Delta H}{\sin\theta} \;\sim\; \frac{2H_o}{\theta} \;\sim\; \frac{1}{4}\,\frac{L}{D}\,R_\oplus \tag{E.134}$$

Since the U.S. Space Shuttle had $L/D \approx 2.5$, Eq. (E.134) shows that it could travel ~ 4000 km during reentry. Thus the reentry began very far from the actual landing site. Because the shuttle had no fuel to maneuver during landing, it arrived at the landing site with excess altitude to ensure that it would not fall short of the runway. If the extra altitude was not needed for contingencies, the shuttle banked back and forth to burn off the extra altitude before approaching the runway.

Inserting Eqs. (E.94) and (E.124) into Eq. (E.92), the heat transfer to a lifting reentry vehicle is

$$q_{\text{vehicle}} \approx 1 \times 10^{-4} \sqrt{\frac{\rho_o}{R}}\, v_o^3\, e^{-H/2H_o} \left(1 + \frac{R_\oplus C_L A \rho_o}{2m}\, e^{-H/H_o}\right)^{-3/2} \frac{\text{W}}{\text{m}^2} \qquad \text{(E.135)}$$

Setting $dq_{\text{vehicle}}/dH = 0$ and solving for H yields the altitude where peak heat transfer occurs:

$$H_{\text{max heat}} = H_o \ln\left(\frac{R_\oplus C_L A \rho_o}{m}\right) \qquad \text{(E.136)}$$

Inserting Eq. (E.136) into Eq. (E.135), the maximum heat transfer to a lifting reentry vehicle is

$$q_{\text{vehicle, max}} \approx 5 \times 10^{-5}\, v_o^3 \sqrt{\frac{\rho_o m}{R R_\oplus C_L A \rho_o}} \quad \frac{\text{W}}{\text{m}^2} \qquad \text{(E.137)}$$

As a good number to keep in mind for comparison, sunlight warms an absorbing surface with a heat transfer rate of approximately 1.4 kW/m^2 above the Earth's atmosphere (or somewhat less on Earth's surface, after the atmosphere has filtered out some of the solar radiation).

For a Space Shuttle reentry with typical values $H_0 \approx 6500$ m, $R_\oplus \approx 6.38 \times 10^6$ m, $C_L \approx 2$, $A \sim 400$ m^2, $\rho_o \approx 1.225$ kg/m^3, and $m = 1{\times}10^5$ kg, Eq. (E.136) indicates that maximum heat transfer occurs at an altitude $H_{\text{max heat}} \sim 70$ km, or an atmospheric pressure $\rho_{\text{max heat}} = m/(R_\oplus C_L A) \sim 2 \times 10^{-5}$ kg/m^3. Also using the representative values $R \sim 20$ m and $v_o \approx 8000$ m/sec, the maximum heat transfer is $q_{\text{vehicle, max}} \sim 25$ kW/m^2, or ∼40x lower than the ballistic case. Note that the large lift means the decelerating vehicle can stay much higher in the atmosphere much longer than a ballistic vehicle with no lift, changing the point of maximum heating to a much higher altitude, much lower atmospheric density, and much lower peak heat transfer. In fact, the heat transfer is sufficiently low that silica tiles were sufficient to insulate the vehicle and re-radiate the heat to the surrounding atmosphere, whereas higher heat transfer values would require single-use ablative heat shields.

Neglecting relatively insignificant changes in the other parameters in Eq. (E.137), the main difference between the U.S. Space Shuttle and the older German spacecraft that were under development was velocity. The Space Shuttle had to reenter from an orbital velocity $v \approx 8000$ m/sec. The German vehicles did not have to reach orbit and would have had lower velocities. Because the velocity is cubed in Eq. (E.137), their heat transfer rates were much lower.

For the A-9 by itself (launched without the A-10 booster stage), the maximum velocity would have been $v \approx 1750$ m/sec (based on the A-4 from Table E.4), so the maximum heat transfer during reentry would have been $q_{\text{vehicle, max}} \sim 0.26$ kW/m^2, much smaller even than solar heating. Thus reentry heating would not have been a problem at all, at least with a properly chosen trajectory.

For the A-9 launched from the A-10 booster stage, the maximum velocity would have been higher, $v \approx 3870$ m/sec from Eq. (E.68). The maximum reentry heat transfer would have been $q_{\text{vehicle, max}} \sim 2.8$ kW/m^2, only about twice as much as solar heating, and roughly nine times smaller than the heating experienced by the U.S. Space Shuttle. Again, reentry heating would not have been a problem with a properly chosen trajectory.

For Silbervogel, the maximum velocity would have been even higher, $v \approx 6170$ m/sec from Eq. (E.72). The maximum reentry heat transfer would have been $q_{\text{vehicle, max}} \sim 11$ kW/m^2, still less than half the heating experienced by the U.S. Space Shuttle. Silbervogel also would have experienced this heating for a shorter period of time than the Space Shuttle, since it would not have been coming all the way from orbital velocity. Suitable metal alloys might have withstood and re-radiated the heat during Silbervogel's reentry while insulation protected the interior, or ablative coatings could have been added to the exterior. The greatest problem with Silbervogel's design is that heating would have been concentrated at the sharp leading edges of the vehicle, as opposed to the rounded leading edges of the Space Shuttle. However, because realistically the Silbervogel would not have been reused if launched during wartime, whereas the Space Shuttle was designed to be reused for many flights, this level of heating could have been acceptable.

Thus from this simple theoretical analysis, it appears that there are no fundamental reasons why an A-9, A-9/A-10, or Silbervogel could not have survived reentry.

C. Skip reentry

If desired, a vehicle can skip off the upper atmosphere like a fast-moving flat rock skipping off the surface of a pond, and this is called a skip reentry (Figs. E.269 and E.270). This was the main idea of Silbervogel, which would have used rocket power to achieve a suborbital flight and then would have repeatedly skipped off the atmosphere to travel most of the way around the Earth before reentering for a final time and landing. One skip with initial velocity v_i will be considered here to illustrate the basic principle.

Gravity and centrifugal force are negligible relative to the strong aerodynamic forces involved in skipping off the atmosphere. Newton's second law parallel and perpendicular to the trajectory is

$$m\,\frac{dv}{dt} = -D \tag{E.138}$$

$$mv\,\frac{d\theta}{dt} = L \tag{E.139}$$

Taking the ratio of Eqs. (E.138) and (E.139) gives the variation of velocity with vehicle pitch angle,

$$\frac{dv}{d\theta} = \frac{dv/dt}{d\theta/dt} = -\frac{D}{L}\,v \tag{E.140}$$

Equation (E.140) describes exponential decay due to drag during the skip, so its solution is

$$v = v_i \exp\left[-\frac{D}{L}(\theta - \theta_i)\right] , \tag{E.141}$$

in which θ_i is the initial pitch angle for atmospheric entry. If the vehicle does not lose much of its velocity during the skip, its pitch angle θ_f leaving the atmosphere is approximately the mirror image of the angle entering the atmosphere, $\theta_f = -\theta_i$, like a light ray reflecting off a surface. Using these angles in Eq. (E.141) yields

$$v_f = v_i \exp\left(-2\theta_i \frac{D}{L}\right) \tag{E.142}$$

Newton's second law perpendicular to the trajectory in Eqs. (E.138) and (E.139) indicates that

$$\frac{d\theta}{dt} = \frac{C_L A \rho v}{2m} \tag{E.143}$$

An equation for the altitude may be found by taking the ratio of $dH/dt = v \sin\theta$ and Eq. (E.143):

$$\begin{aligned} \frac{dH}{d\theta} &= \frac{dH/dt}{d\theta/dt} = \frac{2m\sin\theta}{C_L A\rho} \\ &= \frac{2m\sin\theta}{C_L A\rho_o e^{-H/H_o}} \end{aligned} \tag{E.144}$$

Separating variables in Eq. (E.144) and integrating gives the minimum altitude during the skip:

$$\begin{aligned} \frac{C_L A\rho_o}{2m}\int_{\infty}^{H_{\min}} dH\, e^{-H/H_o} &= \int_{\theta_i}^{0} d\theta\, \sin\theta \\ \Longrightarrow\quad H_{\min} &= H_o \ln\left[\frac{C_L A\rho_o H_o}{2m(1-\cos\theta_i)}\right] \end{aligned} \tag{E.145}$$

Pilots are generally happier if $H_{\min}$ is greater than 0, which means that the argument of the logarithm in Eq. (E.145) must be greater than 1. For small values of θ_i, the approximation $\cos\theta_i \approx 1 - \theta_i^2/2$ may be used, and the positive altitude requirement reduces to:

$$\theta_i^2 < \frac{C_L A\rho_o H_o}{m} \tag{E.146}$$

Thus skipping requires a small entry angle θ_i and/or large coefficient of lift C_L.

Using Eq. (E.145), the atmospheric density at the minimum altitude is

$$\rho_{\text{at min}} = \rho_o\, e^{-H_{\min}/H_o} = \frac{2m(1-\cos\theta_i)}{C_L A H_o} \tag{E.147}$$

The maximum acceleration is lateral due to the lift and occurs at the minimum altitude:

$$
\begin{aligned}
|a|_{\max} &= \frac{L_{\text{atmin}}}{m} = \frac{C_L A \rho_{\text{at min}} v_{\text{at min}}^2}{2m} \\
&= \frac{v_i^2}{H_o}\,(1-\cos\theta_i)\exp\left(-2\theta_i\,\frac{D}{L}\right) \\
&\approx 490\left(\frac{v_i}{v_o}\right)^2 \theta_i^2 \exp\left(-2\theta_i\,\frac{D}{L}\right)\ \text{g} \qquad \text{(E.148)}
\end{aligned}
$$

Using $v_i \sim v_o$ and $\theta_i = 5^o \approx 0.087$ rad and neglecting the exponential factor yields $|a|_{\max} \approx 3.7$ g.

The ground range Δx traversed while the angle changes by $\Delta\theta$ may be estimated from Eq. (E.143):

$$
\Delta\theta \sim \frac{C_L A \rho}{2m}\, v\,\Delta t \sim \frac{C_L A \rho}{2m}\,\Delta x \qquad \text{(E.149)}
$$

Using Eq. (E.149) with $\Delta\theta = 2\theta_i$, the ground range covered during the entire skip maneuver is

$$
(\Delta x)_{\text{skip}} \sim \frac{2m}{C_L A \rho_{\text{atmin}}}\,2\theta_i = \frac{2\theta_i}{1-\cos\theta_i}\,H_o \approx \frac{26\ \text{km}}{\theta_i}\,, \qquad \text{(E.150)}
$$

which is ~ 300 km for $\theta_i = 5^o \approx 0.087$ rad. The range travelled above the atmosphere between each skip would be much larger than that (Fig. E.269).

In addition to suborbital bombers, skip reentries are extremely useful for aerobraking, or slowing an interplanetary spacecraft into orbit when it arrives at its target planet. By plotting the spacecraft's trajectory so that its perigee slightly dips into the planet's upper atmosphere, one can cause the spacecraft to lose enough velocity to lower its apogee from infinity (escape velocity) to some finite value for an orbit around the planet. If the velocity loss on one skip is not too great, just the trajectory of the spacecraft tangentially grazing the curved atmosphere of the planet is enough to cause the spacecraft to "pull up" from the skip, even if the vehicle is not capable of lift. In practice, though, it is better to employ lift as in the skip example calculated above, since it affords much more control over the aerobraking process to deal with fluctuations in atmospheric density. If necessary to minimize the forces and heating the spacecraft experiences during each skip, several successive passes through a planet's atmosphere with a small skip each time can be used to aerobrake from very large initial velocities.

D. Double-dip reentry

Skip reentries are also useful as part of a more complicated maneuver called a double-dip reentry (Fig. E.270), which is used by spacecraft returning to the Earth from deep space, such as in the Apollo missions to the moon.

E.8 Conclusions

This final section gives a brief overview of some possible combinations of payloads and delivery vehicles, as well as broader conclusions based on information in this and the other appendices.

While rocket pioneers such as Hermann Oberth and Wernher von Braun always wanted to use rockets to carry scientific instruments or astronauts to explore space, and jet pioneers such as Hans von Ohain hoped to utilize faster aircraft to improve transportation networks, wartime priorities and wartime funding compelled the creators of new aerospace vehicles to consider methods of using those vehicles to deliver destructive payloads to military targets.

E.8.1 Payloads

Military payloads that were used or planned may be divided into several categories:

- Conventional explosives. These were extensively used with the V-1 cruise missile, A-4 or V-2 liquid propellant ballistic missile, Rheinbote solid propellant ballistic missile, and a wide variety of aircraft. Yet the enormous expense of developing such vehicles, and the great difficulty of successfully sending many of them to distant Allied targets, strongly suggest that conventional explosives were not the primary intended payload, but only an interim measure while other payloads were being perfected or debated.

- Fuel-air explosives. Although fuel-air explosives also use conventional explosives, they disperse those in the air before igniting them, then combust them with oxygen from the air, so the resulting blast affects a much larger area than a conventional bomb with the same amount of explosive would. Beginning in the 1930s, large teams of German-speaking scientists developed and demonstrated fuel-air explosives. By the end of the war, fuel-air explosive bombs weighing up to several tons each had been mass-produced and stockpiled (pp. 538–557). Such fuel-air explosives could have been intended for delivery by aircraft or by large missiles.

- Biological weapons. According to official histories, Germany's wartime work on biological weapons was only defensive (developing methods to protect against biological weapons) instead of offensive (developing biological weapons and methods to disseminate them). Yet as shown by the examples in Section A.3, many credible wartime and early postwar documents from archives mentioned offensive development of biological weapons, and even mass production and packaging of such weapons into deployable bombs. Since so many other relevant documents were either destroyed or remain buried in classified archives, the details of the German biological weapons program are even more mysterious than those of the German nuclear weapons program. Nonetheless, if biological weapons were indeed produced, they could have been intended for delivery by a wide range of aircraft, missiles, or other methods.

- Chemical weapons. The nerve agents tabun and sarin were mass-produced and packaged into bombs in wartime Germany (Section 3.5). Soman was produced and tested on an experimental scale, and could potentially have been packaged into bombs before the end of the war. The even more deadly V-series nerve agents were invented, synthesized, and tested during the war (Section A.4); it is possible that they were produced on a large scale. Germany also produced a number of chemical weapons other than nerve agents, ranging from highly corrosive chemicals to endothermic reactions reported to cause freezing conditions. Any of those chemical weapons could potentially have been delivered by aircraft, missiles, or other means.

- Nuclear weapons, including fission bombs (Section D.8), fusion bombs (H-bombs, Section D.9), and radiological weapons (radioactive "dirty" bombs, p. 5171). There is considerable evidence that fission bombs were successfully tested during the war (Sections D.10, D.11, and D.12), and that a hydrogen bomb was nearing completion when the war ended (Section D.9). Given the enormous amount of resources that would have been invested in developing nuclear weapons, and Germany's desperate state late in the war, there must have been concrete plans and methods for delivering such weapons to Allied targets, including targets in the United States. In the usual German fashion, several different delivery methods, including aircraft and large missiles, were probably developed in parallel.

E.8.2 Delivery Vehicles

There is significant evidence that Germany was developing the following specific methods to deliver weapons of mass destruction (especially nuclear weapons) to Allied targets such as New York and Washington, D.C.:

1. There is documentary evidence for intercontinental bomber aircraft, and for nuclear weapons designed to be dropped by such aircraft (often dropped with a parachute, indicating that the expected blast was so large that the aircraft needed more time to escape to a safe distance after dropping the bomb). See for example:

Erwin Respondek (p. 4194)

Werner Grothmann (pp. 4272 and 4436)

Edmund Tilley (p. 4350)

Stars and Stripes, *Washington Post*, and other major newspapers (p. 5197)

Werner Wächter (pp. 4640–4664)

Hermann Goering (p. 5200)

Other postwar Allied discoveries of intercontinental jet bombers intended to attack the United States (Section E.1)

2. There is documentary evidence that V-1 cruise missiles were modified to attack the United States with a payload sufficiently destructive to justify the mission. There were several different versions of the V-1 that could be ground-launched, submarine-launched, or air-launched from a large aircraft, and that were either unmanned or manned. See for example:

Allied discoveries of piloted and air-launched V-1 missiles (p. 1841)

Interrogation of Edmund Sorg regarding nuclear-armed V-1 missiles (pp. 4896–4897)

Hans Kammler's 23 April 1945 telegram ordering the destruction of special V-1s near Berlin to prevent them from being captured by Russian forces (p. 4897)

Allied intelligence reports on submarine-launched V-1 missiles intended to attack the United States (pp. 5618–5627)

3. There is a great deal of evidence that the A-4 (V-2), A-9/A-10, Silbervogel, or other rockets were intended and even fully built to carry nuclear weapons. (Such rockets were primarily ground-launched, although the A-4 or smaller rockets could be submarine-launched.) See for example:

Hermann Zumpe (p. 4359)
Wernher von Braun (pp. 4361–4362)
Eugen Sänger and Irene Bredt (p. 4363)

Squadron Leader E. J. André Kenny (p. 5763)

E.8.3 Forgotten History

History is a series of factual events that actually occurred. Something either really happened, or really did not. An event either happened one way, or it happened another way. Afterward, different sources may make contradictory claims about what happened, or all references to a particular historical event may be silenced or erased. As a result, it may not be possible to know exactly what happened at certain places and times in the past, yet that does not change the fact that concrete events and actions did in fact occur.

Conventional history almost uniformly paints a particular picture of advanced weapons technology during and after World War II. According to conventional history, Germany experimented with nerve agents but never considered using them for fear of Allied chemical weapons. According to conventional history, Germany never produced nuclear weapons, biological weapons, or fuel-air bombs. According to conventional history, Germany never built intercontinental jet bombers, V-1 cruise missiles capable of striking the United States, or any rockets with larger sizes or longer ranges than the A-4 (V-2). According to conventional history, the V-1 and V-2 programs were foolish and counterproductive for Germany. According to conventional history, the steady march toward Allied victory was simply a matter of time, drawn out only by an irrational German stubbornness to admit the inevitable defeat. According to conventional history, the United States and United Kingdom demonstrated technological superiority over Germany by inventing radar, building and exploding the first fission bombs, and winning World War II. According to conventional history, the United States further proved its own inherent technological superiority after the war by inventing the hydrogen bomb, jet fighters, stealth technology, smart bombs, transistors, computers, lasers, plastics, the contraceptive pill, and biotechnology, as well as by winning the Space Race and the Cold War.

That conventional history, taught nearly worldwide and learned by heart for 75+ years, appears to be a fictional canvas that was painted by a combination of people who knew it was false and others who hoped it was true. That fictional canvas is punctured and torn by large numbers of highly placed Allied and German sources quoted in this book, by more that could be cited, and by others that remain yet to be discovered in archives. Behind that tattered canvas lies the true history of wartime and postwar advanced technologies.

Documents record that German-speaking scientists invented and successfully demonstrated jet fighters, radar, stealth technology, smart bombs, transistors, computers, plastics, the contraceptive pill, and biotechnology, and were developing lasers when the war ended. Documents record that all of those creations and countless others were transferred to the United States, which later claimed credit for them. Documents record that German-controlled territory was filled with an interconnected infrastructure of hundreds of high-tech research and manufacturing sites from Norway to Strassburg (Strasbourg) to Budapest to Königsberg (Kaliningrad), many of them in huge, fully furnished underground installations, some of them even equipped with video conferencing systems and computers. Documents record that wartime Germany successfully developed fuel-air bombs, chemical weapons up to advanced V-series nerve agents, biological weapons, and fission bombs, and that it was close to finishing a hydrogen bomb when the war ended. Documents record that wartime Germany built at least 40 intercontinental jet bombers, several different types of rockets larger than the A-4, and at least two different types of piloted space planes. Documents record that weapons of mass destruction were integrated with delivery vehicles corresponding to all elements of the modern nuclear triad—ground-launched intercontinental missiles, submarine-launched missiles, and intercontinental jet bombers—for missions to Allied targets, including U.S. cities.

Then the Allies won.

What happened, what really happened? The conventional historical explanation that those advanced German technologies never existed is simply untenable in the face of so much evidence. Perhaps the weapons of mass destruction or their delivery vehicles were not quite ready before the end of the war, slowed by Allied attacks, sabotage, or mismanagement by senior German officials. Maybe the weapons and vehicles were ready, but their numbers and their probability of success were too small for it to be strategically useful to employ them late in the war. It could be that the novel threat of mutual assured destruction (MAD, by primitive but effective chemical weapons from the Allied side, and by nuclear, biological, and advanced chemical weapons from the German side) constrained both sides to fight the war to its end using only conventional weapons. Perhaps during the war, the Allies secretly contacted key German officials, such as Hans Kammler, and made it far more personally rewarding for those officials to turn over German advanced weapons technologies to the Allies than to employ them against the Allies. Or maybe some combination of those factors is the true explanation.

There are countless questions that still need to be answered, vast amounts of evidence that still must be sought in classified archives and industrial archaeological excavations. What is certain is that the real history of wartime and postwar technology does not resemble the fictions that have been repeated in history books, documentaries, and films for 75+ years. The real history, the full story, was far more dramatic than that.

And it deserves to be told.

Bibliography

Jeder, der den ganzen Verlauf der wissenschaftlichen Entwickelung kennt, wird natürlich viel freier und richtiger über die Bedeutung einer gegenwärtigen wissenschaftlichen Bewegung denken als derjenige, welcher, in seinem Urtheil auf das von ihm selbst durchlebte Zeitelement beschränkt, nur die augenblickliche Bewegungsrichtung wahrnimmt.

They that know the entire history of the development of science, will, as a matter of course, judge more freely and more correctly of the significance of any present scientific movement than they, who limited in their views to the age in which their own lives have been spent, contemplate merely the momentary trend that the course of intellectual events takes at the present moment.

Ernst Mach. 1897. *Die Mechanik in ihrer Entwickelung: Historisch-kritisch dargestellt.*
3rd ed. Leipzig: F. A. Brockhaus. Introduction. English translation by Thomas J. McCormack.

The Bibliography is organized into a number of broad categories, instead of being one long list with everything mixed together. Please see the following page for an overview of the organization of the Bibliography. Hopefully any difficulties in guessing in which category a citation will be found are greatly outweighed by the convenience to those who are interested in easily perusing all sources on a given topic.

Newspaper articles, series of government reports, and archival references are given in separate lists later in the Bibliography.

Last names with von or vom retain that prefix, but are alphabetized as if it were not there.

Names, dates, and abbreviations used to cite each reference in the book are indicated in bold red font. Dates for newspapers are given as year-month-day, as in 1945-04-30.

I hope that this Bibliography, including its topical sections and especially its sections of report titles and archival locations, will serve as a useful roadmap for other researchers to investigate some of these topics more deeply and to make additional historical discoveries in the future.

Oppenheimer, Erwin K. **2023**. *I'm Afraid!* North Haven, Connecticut: Ezra Company. [This is an English translation of a 1955 French book, *J'ai Peur!* It claims to be an inside account of the German and U.S. nuclear weapons programs by "Erwin Oppenheimer," a scientist who was allegedly involved in both, and it has sometimes been cited as a serious source. Actually the entire book appears to be a work of fiction intended as a cautionary political tale by French journalist Well Allot/François Brigneau and Romanian journalist Gheorghe Barbul. The book's central scientist did not exist under that or any other name, and the book's descriptions of people, events, and scientific details are wildly inaccurate.]

British Intelligence Objectives Subcommittee Evaluation Reports (BIOS ER)

BIOS ER 1 through at least **BIOS ER 576** [NARA RG 319, Entry NM3-82, Boxes 377–378]

British Intelligence Objectives Subcommittee (BIOS) Final Reports

BIOS 1. *Heraklith Plant of Deutsche Magnesit A.G. at Ferndorf, Austria.*

BIOS 2. *German Photoconducting Cells for the Detection of Infra-Red Radiation.*

BIOS 3. *Zimmerit (Anti-Magnetic Plaster for AFVs).*

BIOS 4. *Visits to Targets Connected with the German Plywood Industry.*

BIOS 5. *Report on Visit to the Zellstoffe Fabrik A. G. Near Regensburg: Production of Yeast.*

BIOS 6. *Report on Visit to Munich Technical High School. Dr. Siegfried Windisch on Food Yeast.*

BIOS 7. *The Saccharification of Wood by the Bergius Process at Süddeutschen Holzversuchserung Werke A.G. Regensburg.*

BIOS 8. *Manufacture and Application of Specialized Magnetic Materials Generally.*

BIOS 9. *Interrogation of German Air Ministry (OKL) Technical Personnel Luftwaffe Lager, Near Kiel.*

BIOS 10. *German Plastic Developments, Homogenholzwerke "Holig" G.m.B.H. Baiersbronn, m. Freudenstadt Schwarzwald.*

BIOS 11.

BIOS 12.

BIOS 13. *German Montan-Wax Industry.*

BIOS 14. *High Speed Schlieren Camera for Observation of Flame Travel.*

BIOS 15.

BIOS 16. *Interference Method Studying Air Flow in Turbine.*

BIOS 17. *Statistics: Interrogation of Dr. Rolf Wagenführ Statistical Section of the Planungsamt, Speer Armaments Ministry.*

BIOS 18. *Interview with Dr. K. Freudenberg, Director of Institut für die Chemie des Holzes, Universität, Heidelberg.*

BIOS 19. *Lurgi Gesellschaft für Warmetechnik, m.b.H., Lurgi Gesellschaft für Chemie und Hütterwesen m.b.H., Lurgi Apparatebau G.m.b.H.*

BIOS 20. *Lurgi Gesellschaft für Warmetechnik, Frankfurt.*

BIOS 21.

BIOS 22.

BIOS 23. *High Temperature Ceramics in South Germany.*

BIOS 24. *Peenemunde West.*

BIOS 25. *Copper Smelting and Refining, Particularly from Alloy Scrap and Residues at Zinnwerke Wilhelmsberg Gmb.H Hamburg.*

BIOS 26. *Copper Smelting and Refining, Together with Related Metallurgical Activities at Nord Deutsche Affinerie, Hamburg.*

BIOS 27. *Modern High Explosive Developments at Deutsche Waffen und Munitions Fabriken, A.G., Schlutup near Lübeck.* [RDX, aluminum]

BIOS 28. *The Voith-Schneider Propellor.*

BIOS 29. *German Directed Missiles: Brief Notes on Kochel, Otterbrunn and L.F.A. Volkenrode.*

BIOS 30. *Telefunken Metal/Ceramic Radio Valves.*

BIOS 31. *Rocket Developments in South Germany and Austria.*

BIOS 32. *Albumen and Egg Substitute Industries.* [Serum albumen]

BIOS 33.

BIOS 34. *Interrogation of Dipl. Ing. Ernest Kniepkamp (A F Vs.).*

BIOS 35. *Report on Visit to Daimler-Benz A.G. at Stuttgart—Untertürkheim.*

BIOS 36. *Magnetic Materials and Beryllium.*

BIOS 37. *German Aircraft Industry, Dornier-Werke, Friedrichshafen Area.*

BIOS 38. *Visit to Germany—Electric Power.*

BIOS 39. *Concealed Oil Targets in the Brilion-Bredelar Area.*

BIOS 40. *Optical Activities at Steinheil u. Söhne München.* [AR coatings and optical crystals.]

BIOS 41. [CW]

BIOS 42. *German Oil Storage Blending and Filling Installations. Reports on W.I.F.O. Oil Storage Depots Located at Eickeloh, Ruthen and Nienberg. With Particular Reference to Drum and Can Filling.*

BIOS 43. *Skoda Works, Pilsen, Czecho-Slovakia.*

BIOS 44. With appendices. [CW]

BIOS 45. *J. M. Voith, Maschinen Fabriken (Pulp and Paper Machinery Dept.), Heidenheim.*

BIOS 46. *Feldmuhle Papier und Zellstoff Werke A.G., Reisholz Works, Düsseldorf, Reisholz, Westphalia.*

BIOS 47. *Handliche Papierfabrik, Schöngau Works, Schöngau, Bavaria.*

BIOS 48.

BIOS 49. *Aschaffenburger Zellstoff A.G., Aschaffenburg Mill, Aschaffenburg, Hessen.*

BIOS 50. *Weissenstein Papierfabrik A.G., Pforzheim-Dillweissenstein, Wurtemberg.*

BIOS 51. *Zellstofffabrik Waldhof, Kelheim Mill, Kelheim, Bavaria.*

BIOS 52. *Zellstofffabrik Waldhof, Mannheim Mill, Mannheim, Waldhof.*

BIOS 53. *Feldmuhle Papierfabrik, Hillegossen.*

BIOS 54. *Institut für Cellulose Chemie, Darmstadt.*

BIOS 55. *Papier Fabrik-Kabel Hagen.*

BIOS 56.

BIOS 57. *Scientific Background of the German Chocolate Industry.*

BIOS 58. *Pulping of Beechwood with Nitric Acid at Wolfen Near Leipzig.*

BIOS 59. *Paper Binder Twine.*

BIOS 60. *Robert Bosch G.m.b.H., Stuttgart, and Sundry Dispersal Sites.*

BIOS 61. *Weapons Section of the LFA, Volkenrode, with Notes on Photographic Methods Used in German Ballistics.*

BIOS 62.

BIOS 63.

BIOS 64. *Dental Industry.*

BIOS 65. *Philips Valvo Works, Hamburg; Hammerwerke (Valve Works), Minden; C.H. Müller AG (X-Ray Tube Factory) Hamburg.*

BIOS 66. *Dornier Structural Strength Test Equipment and Methods.*

BIOS 67. *German Airborne Gun and R.P. Sights.*

BIOS 68. *Bosch Sparking Plug Factories.*

BIOS 69.

BIOS 70. *Harburger Gummiwaren-Fabrik Phoenix at Hamburg/Harburg 1.*

BIOS 71. *Chemische Physikalische Versuchsanstalt at Danisch Niendorf.*

BIOS 72. *Vereinigte Flussspatgruben G.m.b.H. at Stulln (United Fluorspar Mines).*

BIOS 73. *Laboratorium für Elektronen und Ionenlehre at Schwarzenfeld.* [Dielectrics research]

BIOS 74.

BIOS 75. *The Production of Acetaldehyd, Acetic Acid, Acetic Anhydride and Acetone fro Acetylene at the Bunawerke, Schkopau.*

BIOS 76. *Pulp & Paper Industry in the Leipzig Area.*

BIOS 77. *German Stereoscopic Rangefinder. Em 4m R.40 Entferungsmesser 4m. Raumbild 40.*

BIOS 78. *Some Aspects of German Powder Metallurgy.*

BIOS 79. *Applied Mathematical Research in Germany, with Particular Reference to Naval Applications.*

BIOS 80. *German Industrial Jewel Bearing Production.*

BIOS 81.

BIOS 82. *Inspection of Hydrogenation and Fischer-Tropsch Plants in Western Germany During September, 1945.*

BIOS 83. *Kaiser Wilhelm Institut für Arbeitsphysiologie (Physiology of Exercise and Application to Industry, Particularly Mining.* [Human performance enhancement]

BIOS 84. *The Production of Bi-metallic Strip in Germany.*

BIOS 85. *Some Developments in Dairying in Germany.* [Albumen]

BIOS 86. *Oils and Fats Industry.*

BIOS 87.

BIOS 88. *Lehr Spinnerei (Model Spinning Mill) Denkendorf.*

BIOS 89.

BIOS 90. [Albumen]

BIOS 91.

BIOS 92. *Production of Acrylonitrile at Leverkusen Plant of I. G. Farbenindustrie.*

BIOS 93. *German Leather Goods and Ancillary Industry.*

BIOS 94. *Kalie-Chemie Rhenania Phosphat Werke, Brunsbüttelkoog.*

BIOS 95.

BIOS 96.

BIOS 97. *Interrogation of German Technicians Engaged on the Design of Turretry and Gun Mountings for Armoured Fighting Vehicles.*

BIOS 98. *Report on German Development of Gas Turbines for Armoured Fighting Vehicles.*

BIOS 99. *Development of German Panzerfaust and Other Hollow Charge Weapons.*

BIOS 100. *Development of Panzerfaust.*

BIOS 101. *German Large Fatigue Testing Machines.*

BIOS 102. *German Electric Detonators, Caps and Fuzeheads.*

BIOS 103. *"Komet"—Installation. A Proposed German Long Range Radio Navigational Aid.*

BIOS 104.

BIOS 105. *Interrogation of Dr. Heinrich Langweiler.*

BIOS 106. *Textile Finishing Machinery for Cotton & Rayon Piece Goods.*

BIOS 107. *Production of a Phosphate Fertiliser by Sintering of Phosphate Rock with Sodium Sulphate and Lignite.*

BIOS 108.

BIOS 109. *Report on German Steel Foundries.*

BIOS 110. *Drägerwerk Factories at Lübeck, Hamburg and Uetersen.* [Protective clothing, respiration filters, sensors, etc. for chemical warfare]

BIOS 111. *Production of Flour and Bread in Germany.*

BIOS 112. *Interim Report of Freon-12 at I. G. Works, Hoechst.*

BIOS 113.

BIOS 114.

BIOS 115. *Report on the Interrogation of Dr. Kurt Stenge.*

BIOS 116. *Pharmaceuticals: Research and Manufacture at I.G. Farbenindustrie.* With supplement. [very large and detailed report]

BIOS 117. *Electrical Dynamometer.*

BIOS 118. *Munich Technical High School. Interrogation of Dr. E. H. Kadmer and Dr. K. Schnauffer.*

BIOS 119. *Deutsche Versuchsanstalt für Luftfahrt (D.V.L.) Institut für Betriebstoff Forschung.*

BIOS 120. *Wirtschaftliche Forschungsgesellschaft m.b.H. Hitzacker Depot.*

BIOS 121. *Wirtschaftliche Forschungsgesellschaft m.b.H. (WIFO), Heiligenstadt Installation.*

BIOS 122. *Wirtschaftliche Forschungsgesellschaft m.b.H. Interrogation of Herr Helmut Plote of the Construction Department.*

BIOS 123. *RATO and Walther propulsion.*

BIOS 124.

BIOS 125. *Ernst Beuttler Werke, Dinglingen, Near Lahr.*

BIOS 126.

BIOS 127. *The Aluminum Fabricating Plant of Aluminium Wals-on Persbedrljvon N. V., Utrecht, Holland.*

BIOS 128.

BIOS 129. *Some Phases of German Electrical Utility Practice.* [Electricity in Berlin]

BIOS 130. [CW]

BIOS 131. *German Spring Making Industry.*

BIOS 132. *Production and Further Investigation of Wesch Anti-Radar Material.*

BIOS 133. *Visit to Brunswick Region to Study German Developments in Mechanics of Materials Applied to Armaments.*

BIOS 134.

BIOS 135.

BIOS 136. *Investigation of Koepe Winding Practice in the Ruhr District of Germany and the Limburg District of Holland.*

BIOS 137. *Cyclopolyolefines (Paper by Dr. J. W. Reppe, I.G. Farben Research Chemist).* With Appendix.

BIOS 138. [CW]

BIOS 139.

BIOS 140. *The Work Done During the War by the Static Unit of the D.V.L.*

BIOS 141.

BIOS 142. *Information Obtained from Targets of Opportunity in the Sonthofen Area.* [Zuse, atomic aircraft, fuel-air explosives, Josef Ernst, von Ardenne, Zippermayr, etc.]

BIOS 143. *German Porous Ceramic Industry.*

BIOS 144. *Wrought Light Alloy Plants in North-West Germany.*

BIOS 145. *Technical High School, Munich.*

BIOS 146. *Air and Oil Filtration in Germany.*

BIOS 147. *Reciprocating Aero Engines (Daimler Benz).*

BIOS 148. *German Betatrons.*

BIOS 149. *Report on Visit to H. Maihak A.G., Hamburg.*

BIOS 150. *Some Aspects of the German Leather Industry.*

BIOS 151. *German Aluminum and Magnesium Melting and Rolling Practices.*

BIOS 152. *Developments in Protective Clothing in Germany.*

BIOS 153. *Miscellaneous German Radio and Communication Targets.*

BIOS 154. *Turntable for German Railway Gun. 28 cm. K 5 (E).*

BIOS 155. [Synthetic fibres]

BIOS 156. *Vereinigte Glanzstoff G.m.b.h. 14–16 Auerschule Strasse, Elberfeld, Wuppertal.*

BIOS 157.

BIOS 158. *Production of Beryllia and Beryllium at Degussa Plants.*

BIOS 159. *Report on Visit to Aerodynamische Versuchsanstalt Göttingen.* [Canadian team]

BIOS 160. *Luftforschungsanstalt Hermann Göring Volkenrode, Brunswick.* [Canadian team]

BIOS 161. *Interview with Dr. Barchfeld, Chemist at Dynamit A.G. at Troisdorf.*

BIOS 162.

BIOS 163. *Some German Aircraft Armament Projects with Particular Reference to Fire Control Developments.*

BIOS 164. *German Oil Seal Manufacturers.*

BIOS 165. *German Shuttle Block Industry.*

BIOS 166.

BIOS 167.

BIOS 168.

BIOS 169. [Lofer—missing at IWM]

BIOS 170. *Visits to American and French Zones. Aircraft and Aircraft Engines.*

BIOS 171. *Catalytic Hydrogenation of Acetylene to Ethylene, Dr. Alexander Wacker Ges. für Elektrochemische Industrie, Burghausen.*

BIOS 172. *Continental Gummiwerke—"Excelsior" Factory, Limmer, Hanover.* [Rubberized clothing for CW protection]

BIOS 173. *Gummiwaren Fabrik Pheonix, Harburg/Hamburg.*

BIOS 174. *Hanauer Gummischuh Fabrik A.G., Hanau am Main.*

BIOS 175. *Dräger Werke, Lübeck and Hamburg.* [CW protective clothing]

BIOS 176.

BIOS 177.

BIOS 178. *Textile Testing in Germany.*

BIOS 179. *German Cable Industry.*

BIOS 180.

BIOS 181.

BIOS 182. *German Coast Artillery Equipment Employed in the Defence of the West Coast of Denmark.*

BIOS 183. *Report on Investigation of the Design and Operation of High Voltage Networks in Central Germany.*

BIOS 184. *German Camera Industry.*

BIOS 185. *The Cellulose Plastics Industry in Germany.*

BIOS 186. *Dehydrated Potatoes and Vegetables.*

BIOS 187. [CW]

BIOS 188.

BIOS 189.

BIOS 190.

BIOS 191.

BIOS 192. *Supersonic Wind Tunnels and Static Testing of V2.*

BIOS 193.

BIOS 194.

BIOS 195. *Interrogation of Personnel of Elektro-Mekanische Werke.* [Rockets]

BIOS 196. *German Rayon Industry.*

BIOS 197. *Reichsinstitut für Erdolforschung, Technische Hochschule, Hannover.*

BIOS 198.

BIOS 199. *"Ten Years of Oxygen-Gasification at Leuna" by Oberingenieur Sabel.*

BIOS 200. *Organisation of Deutsche Versuchsanstalt für Luftfahrt (D.V.L.).*

BIOS 201. *Visit to C.H.F. Müller AG Röntgenstr. 24 Bahrenfeld, Hamburg.*

BIOS 202.

BIOS 203. *The Non-destructive Testing of Materials and X-Ray Protection Methods.*

BIOS 204. *Hochfrequenz Forschungsinstitut of Dr. Plendl, Thumersbach, Austria.*

BIOS 205. *The K.W.I. für Eisen Forschung Düsseldorf.* [X-ray stress measurement]

BIOS 206.

BIOS 207. *The Magnetophon of A.E.G. 150 Hohenzollern Damm. Berlin/Grunewald.* [short and grumpy]

BIOS 208. *Acoustics Laboratories of the Physikalische Technische Reichsanstalt Göttingen.*

BIOS 209.

BIOS 210. [Submarine anti-sonar coating]

BIOS 211. *Infra-red Research, Dr. A. Becker, 36 Blumenthal Strasse, Heidelberg.*

BIOS 212. *Ultra-sonic Research and Development in X-Ray Equipment. Siemens-Reiniger Werke, AG Erlangen.* [6 MeV betatron]

BIOS 213. *Siemens-Halske Werke, Erlangen.*

BIOS 214. *Non-destructive Testing of Materials, Siemens-Werner Werk "M", Berlin/Siemenstadt.* [ultrasonic sonograms of objects]

BIOS 215. *Interview with Prof. Dr. Rudolf Hase, Bismark Strasse, Gehrden.* [IR bolometer]

BIOS 216. *Report on Visits to (1) the Technical High School, Darmstadt, (2) C. F. Boehringer und Söhne, Mannheim—Waldhof, (3) Dr. Freudenberg, Heidelberg University, (4) Dr. Wolman, Wood Preservation Specialist, Bad Kessingen, (5) Imbert Gas Producer Plant, Cologne.*

BIOS 217.

BIOS 218. *Investigation of Planetaria.*

BIOS 219. *Work on Synthesis and Production of Drugs 3065 (2:2*^{1}*-Dihydroxy-5:5*^{1}*-Dibrome Benzil) and 3214 (2:2*^{1}*-Dihydroxy-3:3*^{1}*-5:5*^{1}*-Tetrachlor Benzil).*

BIOS 220. *Citric acid from fermentation process.*

BIOS 221. *Propeller Development at V.D.M., Frankfurt am Main.*

BIOS 222.

BIOS 223. *Visit to Austro-American Magnesite Co., Radenthein, Austria.*

BIOS 224. *German Underwater Ballistics.*

BIOS 225. *German Gear Cutting Plant, Gear Manufacturing Technique and Design Development.*

BIOS 226. *Metallised Paper Capacitors.*

BIOS 227. *Manufacture of Harmonicas (Mouth Organs) and Accordions.*

BIOS 228.

BIOS 229. *Wrought Light Alloy Plants in Southern Germany.* [Aluminum]

BIOS 230.

BIOS 231.

BIOS 232. *Production of Tantalum at the Works of Siemens and Halske.*

BIOS 233.

BIOS 234.

BIOS 235.

BIOS 236. *Developments in Pure and Applied Microbiology (American, British and French Zones) During World War II.* [lots of biotech]

BIOS 237. *Housing Research of the Institut f”ur Technische Physik, Technische Hochschule Stuttgart.*

BIOS 238. *Visit to Mahle Kom. Ges. Pragstrasse 26, Stuttgart, Bad Cannstadt.*

BIOS 239.

BIOS 240. *Synthetic Tanning Agents and Leather Auxiliary Products of the I. G. Farbenindustrie.*

BIOS 241.

BIOS 242. *Lurgi Apparatebau G.m.b.H. Electro Filter Section.*

BIOS 243.

BIOS 244. *I.G. Hoechst and Ludwigshafen, Manufacture of Sulphuric Acid, I.G. Converter Design and Vanadium Catalyst.*

BIOS 245.

BIOS 246.

BIOS 247. *German Chemical Plant with Particular Reference to Centrifuges.*

BIOS 248. *The Radio Valve and Lamp Industry in Vienna.*

BIOS 249. *Rockets and Guided Missiles.*

BIOS 250. *German Research into Increasing Range and Performance of Flame Throwers.*

BIOS 251. *German Landing Gear, Design and Testing.*

BIOS 252. *I. G. Photopapier Fabrik (AGFA), Leverkusen, Near Cologne.*

BIOS 253. *Production of Silumin Alloys, Horrem.*

BIOS 254. *German Aircraft Industry.*

BIOS 255. *Gas Turbine and Reciprocating Engine Activities.* [piezo sensors, etc.]

BIOS 256. *Phosphoric Acid and Sodium Phosphates in Germany.* [Synthetic citric acid]

BIOS 257. *Metallgesellschaft A.G., Frankfurt, Chemicals for Phosphating Iron and Steel.*

BIOS 258. *Carbon Electrodes, I.G. Farben, Griesheim.*

BIOS 259.

BIOS 260.

BIOS 261. *Hydrofluoric Acid Vereinigte Flusspathgruben G.m.b.H. Stulln.*

BIOS 262. *German Photographic Film Base Industry.*

BIOS 263. *Part I. I.G. Farben Industrie-Oppau Works, Ludwigshafen (Report on Nickel and Iron Powder Plants. Part II. Nord Deutsche Affinerie, Hamburg (Report on the Treatment of Nickel-Copper Ores and Residues).*

BIOS 264. *German Brass and Copper Wire Industry.*

BIOS 265. *The German Bichromate and Chrome Compound Industry.*

BIOS 266. *New Technical Applications of Acetylene.* With Appendix. [Periston]

BIOS 267.

BIOS 268. *German Test Equipment for Materials and Vehicle Components.*

BIOS 269. *A Survey of Some Aspects of German Development on Power Plants and Air Compressors Suitable for A.F.V.*

BIOS 270. *Investigations in Germany by Tank Armament Research, Ministry of Supply.*

BIOS 271.

BIOS 272. *Some Aspects of German Work on High Temperature Materials.* [High temp jet materials + SiC]

BIOS 273. *Symposium of Interrogations and Reports on German Methods of Statistical Reporting.*

BIOS 274. *Technical Developments in German Margarine Industry.* With Addendum.

BIOS 275. *Food Preservation with Special Reference to the Application of Refrigeration.*

BIOS 276. *Telefunken Gesellschaft für Drahtlose Telegraphie m.b.h., Berlin; Special Materials for Radio Valves.*

BIOS 277.

BIOS 278. *Preliminary Survey of the German Hydraulic Industry.*

BIOS 279. *German Technique in the Production of Light Alloys.*

BIOS 280. *Interrogation of Professor Alexander von Philippovich. Petroleum Technologist.*

BIOS 281. *German Circular Lace Braiding Machine Building Industry.*

BIOS 282. *German Casein Plastics Industry.*

BIOS 283. *Precision Machine Tools and Gauges.* With Appendix.

BIOS 284. *German Production of Guns, Gun Mountings and Carriages and Small Arms.*

BIOS 285. *Structural Work at Focke-Wulf, Bad Eilson.*

BIOS 286. *Krupps, Essen and Incorporating Information on Luftfahrtgerätewerke, Hakenfeld Berlin and Activities by Dudenhausen at Rietberg.*

BIOS 287. *Barytes and Pyrite in North-West Germany.*

BIOS 288. *Aluminium Hydrate and Alumina Production in German Factories.*

BIOS 289. *Report on German Textile Machinery Firms.*

BIOS 290. *The Viscose Continuous and Rayon Staple Fibre Plants of the British, American and French Occupation Zones of Germany.*

BIOS 291. *Visit to Deutsche Eisenwerke and Deutsche Rohrenwerke, at Mulheim.*

BIOS 292. *German Aircraft Development as Applicable to Civil Transport.*

BIOS 293. *Methods of Shock Wave Measurement in German Armament Research Establishment.*

BIOS 294. *Hydrogen Peroxide Works of Otto Schickert & Co., at Bad Lauterberg and Rhumspringe.* [Silicon detectors]

BIOS 295. *German S.A.A. Factories.*

BIOS 296. *German Non-Ferrous (Copper-Base) Foundry Industry.*

BIOS 297. *Norddeutsche Seekabelwerke Nordenhaus.*

BIOS 298.

BIOS 299. *The German Ham Canning Industry.*

BIOS 300. *Investigation of the Developments in the German Automobile Industry During the War Period.*

BIOS 301. *German Piston and Piston Ring Industry.*

BIOS 302. *Investigation of Henk Heinrichs' Claim in Connection with the Refining of Aluminium Alloy Scrap.*

BIOS 303. *Production of Luminous Compounds at the Works of Auer Gesellschaft A.G.*

BIOS 304.

BIOS 305. [Insulin]

BIOS 306. *The Manufacture of Caffeine and Theophyline in the U.S. and French Zones.*

BIOS 307. *German Secondary Batteries (with Special Reference to Those Used by Army Signals).* [Alkaline batteries]

BIOS 308.

BIOS 309.

BIOS 310. *Flexible Pipes, Flexible Fuel Tanks and Self-Sealing Fuel Tank Coverings for Aircraft.*

BIOS 311. *Production of Aluminium Sulphate Giulini.*

BIOS 312. *German Papermaking Industry.*

BIOS 313. *Report on Visit to Czechoslovakia by Armament Design Department.* [mentions many significant people and places but gives no significant scientific details]

BIOS 314. *The German Electricity Supply System.*

BIOS 315. *Berliner Lübecker Maschinen Fabrik, Lübeck.*

BIOS 316. *German Light Alloy Foundry Industry.*

BIOS 317. *German Glass Manufacture as Applied to Illumination with Particular Reference to Aviation Lighting.*

BIOS 318. [Oxygen breathing apparatus + suits Draeger]

BIOS 319. *Production of Beryllium "Degussa".*

BIOS 320. *German Aero Engine Industry.*

BIOS 321. *Steel Propellor Blade Development at V.D.M., Hamburg.*

BIOS 322. *Rheinmetal Borsig A.G. Düsseldorf.* [brief report on guns, not missiles]

BIOS 323. *Waggonfabrik A.G. (Ringfeder G.m.b.H.), Uerdingen.*

BIOS 324.

BIOS 325.

BIOS 326.

BIOS 327. *Dandy Roll Making Industry.*

BIOS 328. *Antimony Smelting Industry.*

BIOS 329.

BIOS 330. *Wirtschaftliche Forschungsgesellschaft m.b.H. (WIFO) Eickeloh Installation. Investigation of the Installation and Interrogation of the Personnel.*

BIOS 331. *Amalia Benzole Refinery, Harpener Bergwerksverein, Bochum.*

Combined Intelligence Objectives Subcommittee Evaluation Reports (CIOS ER)

CIOS ER 1. *Professor R. Kuhn at the KWI, Heidelberg.* [synthetic antibiotic 3065]

CIOS ER 2. *Preliminary Reports on Aeronautical Activities at Darmstadt.*

CIOS ER 3. *Oil Team Report on I.G. Farbenindustrie—Heidelberg.*

CIOS ER 4. *I.G. Farbenindustrie at Höchst.*

CIOS ER 5. *Project for Location of Ships by Ionisation Measurements.*

CIOS ER 6. *German Controlled Missiles.*

CIOS ER 7. *Oil Targets in the Ruhr and Hannover Areas.*

CIOS ER 8. *Brief Description of Operation of X-4 Missiles.*

CIOS ER 9. *Information on a Material Possibly Used for or in Jet Propulsion.*

CIOS ER 10. *K.W.I. für Medizinische Forschung, Heidelberg.* [synthetic antibiotic 3065]

CIOS ER 11. *Information on a New Group of Toxic War Gases.*

CIOS ER 12. *I.G. Production of Synthetic Fatty Acids.*

CIOS ER 13. *Heinkel Hirth at Stuttgart.*

CIOS ER 14. *Ammoniawerk Merseburg G.m.b.H. Plant of I.G. Farbenindustrie A.G. at Leuna.*

CIOS ER 15. *I.G. Plastics Activity.*

CIOS ER 16. *I.G. Farbenindustrie A.G. Ludwigshafen-Oppau. Fuels and Lubricants Testing and Development.*

CIOS ER 17. *Dr. Müller Conradi of I.G. Farbenindustrie.*

CIOS ER 18. *Interrogation of Mr. Waldeman Bergner and Mr. Schumacher.*

CIOS ER 19. *Statistics of German Production, Consumption and Stocks of Liquid Fuels, Rubber and Strategic Chemicals.*

CIOS ER 20. *Planning Board of Reich Research Council.*

CIOS ER 21. *Elektrochemisches Werke München A.G.*

CIOS ER 22. *Work in the Heidelberg Area.*

CIOS ER 23. *Robert Bosch G.m.b.H.*

CIOS ER 24. *Friedrich Krupp, Essen.*

CIOS ER 25. *Rheinmetall-Borsig A.G.*

CIOS ER 26. *Information on Poison Gas Manufacture in Germany.*

CIOS ER 27. *Report on I.G. Farbenindustrie Aktiengesellschaft.*

CIOS ER 28. *Report on Metallgesellschaft and Lurgi Gesellschaft für Warmetechnik G.m.b.H.*

CIOS ER 29. *Visit to Krupps Experimental Range, Meppen.*

CIOS ER 30. *Report on Giessling Pulver "Cast" Rocket Propellant at Wolff & Co., Bomlitz.*

CIOS ER 31. *I.G. Farbenindustrie at Höchst.*

CIOS ER 32. *The Records of the Fedwirtschaftsamt of the O.K.W.*

CIOS ER 33. *Interview with Dr. Klebert, Dr. Redies and Dr. Knonradi: Synthetic Rubber, Chemical Warfare.*

CIOS ER 34. *Assessment Report, Degaussing Laboratory, Physikalische Institut, University of Tübingen.*

CIOS ER 35. *I.G. Farbenindustrie at Frankfurt.*

CIOS ER 36. *Investigation of Ruhr Synthetic Oil Plants.*

CIOS ER 37. *I.G. Farbenindustrie at Bitterfeld.*

CIOS ER 38. *Luftschiffbau Zeppelin—Dir. Eckener.*

CIOS ER 39. *Lechfeld Airfield.*

CIOS ER 40. *Sonderausschuss A-4.*

CIOS ER 41. *Dr. Butefisch, a Director of I.G. Farbenindustrie and a Member of Its Executive Technical Committee and an Expert on Coal Hydrogenation.*

CIOS ER 42. *Professor Waninger, Chief of Research, Rheinmetall-Borsig.*

CIOS ER 43. *Interrogation of Bruckmann and Hagen on B.M.W. Jet Engines.*

CIOS ER 44. *Dr. Michael Jahrstorfer, Laboratory Director, I.G. Oppau.*

CIOS ER 45. *Junkers Plant, Dessau.*

CIOS ER 46. *Nohler Technical Institute, Brunswick.*

CIOS ER 47. *Discovery of the Luftwaffe Archives.*

CIOS ER 48. *The Manufacture of Hydrogen Peroxide.*

CIOS ER 49. *Dr. Julius Walter Reppe.*

CIOS ER 50. *Gutehoffnungshutte, Sterkrade/Ruhr, Electrodes.*

CIOS ER 51. *Interrogation of Professor Osenberg.*

CIOS ER 52. *Dr. Ambros, Director of I.G. Farben Organic Division, Ludwigshafen.*

CIOS ER 53. *Interrogation of Albert Speer, Former Reich Minister of Armaments and War Production.* 17 parts.

CIOS ER 54. *Interrogation of Dr. Walter Funk.*

CIOS ER 55. *Interrogation of Dr. Karl Haushofer, Professor of Geo-Politics at the University in Munich.*

CIOS ER 56. *Interrogation Report on Diplom Ingenieur Walther Rieder III.*

CIOS ER 57. *Interview with Cardinal Faulhaber, Archibishop of Munich.*

CIOS ER 58. *Messerschmitt Production Plans with Special Reference to the 262 Program.*

CIOS ER 59. *Technical Report on CIOS Special Mission to Hanover.*

CIOS ER 60. *Dr. Christian Henry Poltz.*

CIOS ER 61. *Forschungsinstitut für Kraftfahrwesen und Fahrzeugmotoren Stuttgart.*

CIOS ER 62. *Important German Naval Vessels, Equipment and Documents.*

CIOS ER 63. *C. H. F. Müller, A.G.*

CIOS ER 64. *Report on Malarial Research Resulting from Interrogation of Professor Claus Schilling.*

CIOS ER 65. *Hydrazine Hydrate (B-Stoff) as a Fuel.*

CIOS ER 66. *Pulp and Paper Activities in the Mannheim, Darmstadt, and Heidelberg Area.*

CIOS ER 67. *TE KA DE Electric Valve Factory—C. F. Weiss Textile Mills, Helmbrechts: Siemens Halske Telephone Equipment Factory Hannerman Mills, Azch, Czechoslovakia.*

CIOS ER 68. *Flugtechnisches Fachgruppe.*

CIOS ER 69. *Junkers Werke, Dessau (Jumo and JFA Planes).*

CIOS ER 70. *Gelsenberg A.G.*

CIOS ER 71. *Telefunken, C. R. Tube Laboratory and Factory, Bad Liebenstein; A.E.G. Research Labs, Electronic Valve Application Laboratory and Factory, Clausthal-Zellerfeld; E. Leybold's Nachfolger Laboratory, Berg Academy, Clausthal-Zellerfeld.*

CIOS ER 72. *Aircraft Instrument Factory, Plauen, and Dr. Theodor Horn A.G., Villa Leuche, Oppenstrasse, Jochrita.*

CIOS ER 73. *Chemical Plant, Dr. Alexander Wacker Gesellschaft für Electrochemische Industrie Combit, Burghausen, Bavaria, Germany. Chemical Laboratory, Laboratory Removed from I.G. Farbenindustrie A.G., Weinheim, Germany.*

CIOS ER 74. *Gas Filling Plant and Munitions Dump Near St. Georgen, Bavaria. Anorgana G.m.b.H. Werke, Gendorf, Bavaria.*

CIOS ER 75. *Zentralforschungsstelle für Hoch Frequenz, Dornstadt.*

CIOS ER 76. *Brown-Boveri Co., Mannheim District, Weinheim, Ederbach, Reigheim, Heidelberg, Mannheim-Kakertal.*

CIOS ER 77. *Funk Versuchungsanstelle für Kriegsmarine, Pelzerhagen Near Neustadt.*

CIOS ER 78. *Messerschmidt Assembly Plant, Landsberg.*

CIOS ER 79. *Dipl. Chem. Paul Schneider.*

CIOS ER 80. *Seewerkes, Immenstaad der Luftschiffbau, Zeppelin G.m.b.H., Friedrichshafen.*

CIOS ER 81. *Gesellschaft für Fernmeldetechnik, Munich.*

CIOS ER 82. *Interrogation Notes on CIOS Trip No. 108, Frankfurt and Hoechst.*

CIOS ER 83. *Report on the Bp-20 Aircraft.*

CIOS ER 84. *Spangenburg Werke, Hamburg.*

CIOS ER 85. *Luftfahrtforschungsanstalt Hermann Goering, Volkenrode/Brunswick.*

CIOS ER 86. *International Hydrogenation Engineering and Chemical Co., and International Hydrogenation Patents Company, The Hague, Holland.*

CIOS ER 87. *Investigation of Dannenberg V-1 Assembly Plant.*

CIOS ER 88. *Aerodynamisches Institut der Technischen.*

CIOS ER 89. *Visit of CIOS Team to Oil Centers in Leuna, Lutzkendorf., Zeitz, Bohlen, Stassfurt, and Other Areas.*

CIOS ER 90. *Atlas Werke, Munich.*

CIOS ER 91. *Seekartewerke OKM, Kaufbeuren.*

CIOS ER 92. *Deutsche Forschungsanstalt für Segelflug.*

CIOS ER 93. *Dornier Werke G.m.b.H. Lindau.*

CIOS ER 94. *Interrogation of Messerschmitt Personnel on Hydraulic Systems and Pressure Cabins.*

CIOS ER 95. *Medical Research in Occupied Holland.*

CIOS ER 96. *Report on a Visit to D.W.M., Karlsruhe.*

CIOS ER 97. *Luftfahrt-Forschungsanstalt München Medizinisches Institut Garmisch-Partenkirchen.*

CIOS ER 98. *Sievers, Wolfram, Reichsgeschäftsführer des "Ahnenerbes", S. S. Standartenführer, Berlin—Dahlem, Pucklerstr. 16—Personnel and Types of Experiments Performed at Dachau Universities.*

CIOS ER 99. *German Headquarters in Denmark.*

CIOS ER 100. *Prison Camps "Emsland".*

CIOS ER 101. *Residence of Reichsbevollmachtiger Danemark, Dr. Werner Best. Rydhave, Strandvejen, Copenhagen.*

CIOS ER 102. *List of Personnel in Charge of Research Sections of the Hannover Technische Hochschule.*

CIOS ER 103. *Ael-Nordmakr Arbeitsereichungslager Russee Nort of Kiel.*

CIOS ER 104. *Laboratories of Bataafsche Petroleum Maatschappij (B.P.M.).*

CIOS ER 105. *Report on German Radar Industry.*

CIOS ER 106. *Industriekontor G.m.b.H.*

CIOS ER 107. *DVL Garmisch.*

CIOS ER 108. *Gas Turbine Research Group Headed by Dr. Max Müller.*

CIOS ER 136. *Nachrichtenmittelversuchkommando, Funkversuchsstelle, Pelzerhaken (Neustadt).*

CIOS ER 137. *The Kriegsmarine Research Ship "Strahl" in Flensburg Harbor.*

CIOS ER 138. *Universität Kiel. Hagenuk Hanseat Apparatebau Ges. Neufeldt and Kuhnke G.m.b.H., Research Laboratories*

CIOS ER 139. *Drs. Kleen and Lerbs.* [radar/CM]

CIOS ER 140. *Dr. Dohler, Hamburg University.*

CIOS ER 141. *Rustungsstab Danemark Vesterport, Copenhagen.*

CIOS ER 142. *Dr. Asser (Research and Development; Yield and Quality of Natural Resins; Coal Tar Products by Low Pressure Distillation).*

CIOS ER 143. *Eisenwerke Oberdonau, Linz, Austria.*

CIOS ER 144. *Dynamit A.G., Duneburg.*

CIOS ER 145. *Schimmel and Co., Miltitz Near Leipzig.*

CIOS ER 146. *Interrogation of Dr. Georg Otto Erb at Maria Veen a 5660, near Coesfed. Electric Detonators—Types of Fuzes.*

CIOS ER 147. *Karl Baddstein, Hamburg.*

CIOS ER 148. *Kohle-Oel-Union Von Busfg Kommanditgesellschaft (Oil Recovery from Shale).*

CIOS ER 149. *Junkers Aircraft at Dessau, Aschersleben, Bernburg, Raguhn, Schonebeck, Tarthum, Jessnity, Halle and Schkeuditz.*

CIOS ER 150. *Report on CIOS Trip No. 311, Wendelstein.*

CIOS ER 151. *Group of Designers and Engineers Headed by Dipl. E. Ing. Kemper, Specializing on Governor Gear for All German Jet Propulsion Units and Aero Engines.*

CIOS ER 152. *Braunschweiger Huttenwerk G.m.b.H., Plain Bearing Manufacture, Brunswick.*

CIOS ER 153. *Interrogation of Herr Stiele von Heydekampf. German Tank and Engine Program.*

CIOS ER 154. *Interrogation of Herr Schaaf.*

CIOS ER 155. *Flettner Helicopters—Statement by Anton Flettner.*

CIOS ER 156. *Report on Flugfunk Forschungsinstitut Oberpfaffenhofen F.F.O. and Establishments.* [smart bombs, proximity fuses, semiconductors]

CIOS ER 157. *Branch of Telefunken Laboratories.*

CIOS ER 158. *Physical Investigations of Selenium and Caesium-Oxide Surfaces.*

CIOS ER 159. *Cyclotron Investigation at Heidelberg. Interview with Prof. Walter Bothe.* [also synthetic antibiotic 3065]

CIOS ER 160. *German Infra-Red and Ultra-Violet Developments.*

CIOS ER 161. *Supplement to Evaluation Report No. 139—Report on Dr. Kleen and Dr. Lerbs of Telefunken.*

CIOS ER 162. *Interrogation of Albert Speer by Members of the Ministry of Supply.*

CIOS ER 163. *Interrogation for CIOS of Saur, Head of Technical Department, in Speer Ministry.*

CIOS ER 164. *Interrogation of Dr. Werner Bosch of the Speer Ministry.*

CIOS ER 165. *Interrogation of Ernst-Wolf Mommsen of the Technical Department in the Speer Ministry.*

CIOS ER 166. *Jet Fighter Heinkel 162 (Volksjäger).*

CIOS ER 167. *Details of Contents of Microfilm on Captured Documents Pertaining to German Torpedo Developments.*

CIOS ER 168. *Reichskommissar für die Seeschifffahrt und Seeschifffahrstsamt.*

CIOS ER 169. *Interrogation of Generaldirektor Frydag of Heinkel.*

CIOS ER 170. *Interrogation of Dr. Carl Bosch: Cathode Screens, Selenium Dry Rectifiers.*

CIOS ER 171. *Report on the Interrogation of Mr. Locke.*

CIOS ER 172. *Uhde Gesellschaft für Hochdrucktechnik Dortmund and Bovinghausen, Germany.*

CIOS ER 173. *Drager Werke, Luebeck, Germany.*

CIOS ER 174. *C. H. F. Müller A.G., Hamburg, Fuhsbuttel, Rentgenstrasse 24.* [neutron generator drawings and high voltage tubes]

CIOS ER 175. *Report on St. Johann Winter Proving Ground.*

CIOS ER 176. *Report on Steyr Bearing Plant.*

CIOS ER 177. *Report on Physikalishe-Technische Reichsanstalt at Weide and Zeulenroda, Thüringen.*

CIOS ER 178. *Records and Documents at Grasleben.*

CIOS ER 179. *German (Economic) Personalities in Denmark.*

CIOS ER 180. *Laboratorium für Elektronen u. Ionenlehre, Schwarzenfeld, Formerly of Technische Hochschule, Berlin.*

CIOS ER 181. *Hauptausschuss Waffen of the Speer Ministry.*

CIOS ER 182. *Underground Factory Sites in Ansbach.*

CIOS ER 183. *Report on J. M. Voith Maschinenfabriken.*

CIOS ER 184. *Report on: Drahtwerke Eidelstadt; Rheinische Draht und Kabelwerke.*

CIOS ER 185. *Interrogation of Dipl. Tag. Hohler.*

CIOS ER 186. *Report on Visit to Mannheim Area.*

CIOS ER 187. *Technische Akademie der Luftwaffe, Bad Blankenburg.*

CIOS ER 188. *Report on Deutsche Seewarte.*

CIOS ER 189. *Interrogation of Paul Francois Van Den Boogaard.*

CIOS ER 190. *Report on M.V. Forschungs-Vereinigung.*

CIOS ER 191. *Report on: Siemens and Halske, Hamburg; Vereinigte Bayrische Telefonwerke A.G.*

CIOS ER 192. *Interrogation of Hauptdienstleiter Otto Saur.*

CIOS ER 193. *Report on the Laboratory for Dr. Schnittger of Gehlberg.*

CIOS ER 194. *Closed Cycle Engines.*

CIOS ER 195. *Report on Visit to Offices and Test Shop of the Schmidt'sche Heissdampf G.m.b.H.*

CIOS ER 196. *Report on Flame Research Done at the Physikalische Versuchsanstalt, Danisch Nienhof.*

CIOS ER 197. *Interrogation of General Oberst Von Halder.*

CIOS ER 198. *Report on Askania Werke-Konstanz.*

CIOS ER 199. *Interrogation of Dipl. Ing. Walte at Konstanz, and Visit to Laboratory at Litzelstettin.*

CIOS ER 200. *Physikalisches Institut der Universität, Erlangen, Interrogation of Prof. Dr. Rudolph Hilsch, Head of the Organization.*

CIOS ER 201. *Report on Talstation, Lofer.* [Mario Zippermayr]

CIOS ER 202. *Report on Fernmeldetechnisches Entwicklungslaboratorium and Interrogation of Dr. H. Kimmel.*

CIOS ER 203. *Report on Physical Department of University of Strassbourg at Seefelden.*

CIOS ER 204. *Report on Forschungsanstalt der D.R.P. Post Dienstelle.*

CIOS ER 205. *Interrogation of Dr. Bürk of Telefunken, Berlin.*

CIOS ER 206. *Report on Private Laboratory of Prof. Vierling.*

CIOS ER 207. *Report on Osnabruck Kupfer und Kabel Werke, Klosterstrasse 29.*

CIOS ER 208. *Interrogation at Salzuflen of Dr. Paul Joerz and Dr. Rolf Moller.*

CIOS ER 209. *Inspection of "Müller Montag" Vertical Milling Machine with Copying Attachment.*

CIOS ER 210. *Report on the Manufacture of Chlorate and Perchlorate by I.G. Farben, Bitterfeld.*

CIOS ER 211. *Report on Fire Extinguishing Equipment, Methods and Manufacture in Germany.*

CIOS ER 212. *Report on Coal-Stripping Method and Equipment in Germany.*

CIOS ER 213. *Report on Torpedo Model Experimental Station, Hanover.*

CIOS ER 214. *Ringsdorff-Werke K.G., Mehlem am Rhein.*

CIOS ER 215. *Report on Aircraft Instruments Produced by Firm Albert Pattin of Berlin and Wesben (Interrogation of Herr Rolla).*

CIOS ER 216. *Interrogation of Prof. Pidery (Geo-Physics).*

CIOS ER 217. *Report on Manufacture of Air Photography Apparatus.*

CIOS ER 218. *Report on Stereophotogrammetric Methods of Measuring Wave-Heights at the Deutsche Seewarte.*

CIOS ER 219. *Interrogation of Albert Speer.*

CIOS ER 220. *Interrogation of Dipl. Ing. Helmut Stein, President of Klockner-Deutz-Motoren, Cologne-Deutz.*

CIOS XXXII-75. *German Rocket Power Plants.* [liquid and solid rocket engines]

CIOS XXXII-76. *A Sonic Altimeter for Aircraft.*

CIOS XXXII-77. *The Production of Intense Audio Sounds by an Intermittent Flame.* [acoustic weapon]

CIOS XXXII-78. *The Passive Acoustic Proximity Device "Kranich."*

CIOS XXXII-79. *Passive Acoustic Proximity Fuses for Use Against Bomber Formations.*

CIOS XXXII-80. *Acoustic Steering Control for the X-4 Missile-Dogge.*

CIOS XXXII-81. *The Manufacture of Hard Rubber Parts for Storage Batteries.*

CIOS XXXII-82. *German Acoustic Ground Proximity Fuse.*

CIOS XXXII-83. *Acceleration Tolerances of the Human Body.*

CIOS XXXII-84. *German High Speed Aerodynamic and Guided Missile Research.* [Supersonic flow instruments]

CIOS XXXII-85. *Aerodynamische Versuchsanstalt and The Kaiser Wilhelm Institute Fur Stromungsforschung Gottingen.*

CIOS XXXII-86. *The Manufacture of Propellants, Nitrocellulose and D.G.N.*

CIOS XXXII-87. *Interrogation of Prof. Scherzer of the BHF.*

CIOS XXXII-88. *Stassfurter Rundfunk Stassfurt.* [Remote control for guiding bombs]

CIOS XXXII-89. *Luftfahrtforschungsanstalt, Braunschweig.* [Jet engine research]

CIOS XXXII-90. *Wintershall AG, Lutzkendorf.*

CIOS XXXII-91. *Lurgi Gesellschaft Fur Warmetechnik, Frankfurt-am-Main.*

CIOS XXXII-92. *Brabag I Plant, Bohlen.*

CIOS XXXII-93. *Gesellschaft Fur Teerverwertung G.m.b.H., Duisburg-Meiderich.*

CIOS XXXII-94. *German Petroleum Industry, Hamburg District.*

CIOS XXXII-95. *Telefunken Cathode Ray Tube Laboratories and Leuchtstoffe, Phosphor Manufacture.* [Fluorescent lights]

CIOS XXXII-96. *Ruhrchemie AG, Sterkrade-Holten.*

CIOS XXXII-97. *Budenheim Boiler Feed Water Treatment System.*

CIOS XXXII-98. *Materials for Diesel Engines.*

CIOS XXXII-99. *Metals for Elevated Temperatures.*

CIOS XXXII-100. *Welding in German Shipyards.*

CIOS XXXII-101. *Bremer Vulcan Schiffbau Und Machinenfabrik Vegesacke.*

CIOS XXXII-102. *Radiography and Magnetic Inspection in German Shipyards.*

CIOS XXXII-103. *The Manufacture of Marine Propellers, Blohm and Voss, Hamburg.*

CIOS XXXII-104. *Theodor Zeise Plant, Hamburg Manufacturers of Marine Propellers.*

CIOS XXXII-105. *Materials for Shipbuilding Applications.*

CIOS XXXII-106. *Main Propulsion Steam Turbine Machinery of German Merchant Vessels.*

CIOS XXXII-107. *I.G. Farben AG Works, Leuna.*

CIOS XXXII-108.

CIOS XXXII-109. *Interrogation of Dr. Hans Friedrich Gold.* [atomic energy, rockets, and magnetic propulsion]

CIOS XXXII-110. *Rocket Motor Developments in Germany.*

CIOS XXXII-111. *Device for Solving Aerodynamic Stability Equations for Guided Missiles.* [analog computer]

CIOS XXXII-112. *German Magnetic Pistols.*

CIOS XXXII-113. *German M5 Magnetic Mine Unit.*

CIOS XXXII-114. *German 21cm R-LG Rocket (Flare).*

CIOS XXXII-115. *German Pressure Mine Units and Detecting Components.*

CIOS XXXII-116. *German M-4 Magnetic Mine Unit.*

CIOS XXXII-117. *German Aircraft and Anti-Aircraft Gunnery Training Targets.*

CIOS XXXII-118. *Steel Cartridge Case Plant Fabrique Nationale D'Armes De Guerre, Herstal-Lez-Liege, Belgium.*

CIOS XXXII-119. *German Iron and Steel Industy, Ruhr and Salzgitter Areas.*

CIOS XXXII-120. *Propulsion Turbines for the Walter Process Submarines, Types 17 and 26.*

CIOS XXXII-121. *Reichstelle Fur Kautschuk and Fachgruppe Kautschuk Industrie.*

CIOS XXXII-122. *The War-Time Activities of Dr Ing HCF Porsche, KG.*

CIOS XXXII-123. *German Guided Missiles.*

CIOS XXXII-124. *Items Selected From the Minutes of the Meetings of the IG Technische Ausschuss.* [Synthetic fats]

CIOS XXXII-125. *German Guided Missile Research.* [table of rockets]

CIOS XXXII-126. *Rod and Wire Mills, Deutsche Edelstahlwerke, Krefeld.*

CIOS XXXIII-1. *Visits to CPVA (Danisch Nienhof) and Harburger Gummiwaren-Fabrik Phoenix.*

CIOS XXXIII-2. *Portable Cathode-Ray Electrocardiograph.*

CIOS XXXIII-3. *Report on Acid Smoke Equipment Employed by German Navy.*

CIOS XXXIII-4. *Visit to Mauser Werke AG, Oberndorf Am Neckar and Mauser Personnel at Lager Haiming, Otzal, Near Inssbruck.*

CIOS XXXIII-5. *The Methanisation of Coal Gas Information Obtained from Dr Martin of Ruhrchemie AG and Dr. Traencker of Rhurgas AG*

CIOS XXXIII-6. *The Preparation of Ultra-Clean Coal at the Konigin Elizabeth Colliery, Essen Frillendorf (Mannesmannrohren Werke AG).*

CIOS XXXIII-7. *ZA Hydraulic Steering System for Panther Tank.*

CIOS XXXIII-8. *Maybach Motorenbau G.m.b.H..*

CIOS XXXIII-9. *German Infra-Red Devices and Associated Investigations Report No. 2.*

CIOS XXXIII-10. *German Research and Development in Tank Armour Welding.*

CIOS XXXIII-11. *Visit to MAN Laboratory, Augsburg.*

CIOS XXXIII-12. *German ARC Welding Electrodes and Their Manufacture.*

CIOS XXXIII-13. *Robert Bosch and Deckel Co.* [Internal combustion engine research, high-speed cameras]

CIOS XXXIII-14. *Research on Speech Scrambling in Germany.*

CIOS XXXIII-15. *Verein Fur Die Bergbaulichen Interessen (Bergbau-Verein), Heisingen-Ruhr.*

CIOS XXXIII-16. *F. Krupp AG, Altendorfer Strasse-Essen.*

CIOS XXXIII-17. *Coal Driers, Buttner-Werke AG, Uerdingen-Krefeld.*

CIOS XXXIII-18. *Gelsenkirchenen Bergwerke AG (GBAG), Rosastrasse-Essen and Nordstern-Wanne Eickel.*

CIOS XXXIII-19. *IG Farben Central Rubber Organization at Leverkusen.*

CIOS XXXIII-20. *Deutsche Waffen Und Munitions Fabriken AG, Schultup Near Lubeck.*

CIOS XXXIII-21. *The Magnesium Alloy Industry of Eastern Germany.*

CIOS XXXIII-22. *Preussische Versuchs Und Forschungsanstalt Fur Milchwirtschaft.*

CIOS XXXIII-38. *Underground Factories in Germany.*

CIOS XXXIII-39. *Heinrich Koppers G.m.b.H., Moltke Strasse 29, Essen.*

CIOS XXXIII-40. *Nordstern Coke-Oven Plant Gelsenkirchner Bergwerks AG*

CIOS XXXIII-41. *Research on preparation and Reactions of Nitroparaffins.*

CIOS XXXIII-42. *Hydrogen Peroxide Production at Hollriegelskreuth, Part I, General Notes and Potassium Persulphate Process.*

CIOS XXXIII-43. *Hydrogen Peroxide Production at Hollreigelskreuth, Part II Ammonium Persulphate (All-liquid) Process.*

CIOS XXXIII-44. *Direct Synthesis of Hydrogen Peroxide by Electric Discharge.*

CIOS XXXIII-45. *Hydrogen Peroxide Production at Kufstein.*

CIOS XXXIII-46. *Hydrazine Hydrate and C-Stoff Production at Gersthofen.*

CIOS XXXIII-47. *Manufacture of Sodium and Calcium Permanganate.* [Insulin]

CIOS XXXIII-48. *Report on a Visit to the DAG Small Arms Factory at Stadeln, near Nurnberg.*

CIOS XXXIII-49. [Gas jet cutting machines]

CIOS XXXIII-50. [Synthetic fibers comprehensive survey]

CIOS XXXIII-51. *Report on the Firm of Carl Zeiss, Jena.*

CIOS XXXIII-52. *Investigation of the DWM Cartridge Case Plant at Their Factory at Karlsruhe.*

CIOS XXXIII-53.

CIOS XXXIII-54. *Investigations into the Organization of Ernst Leitz at Wetzlar.* [AR coatings]

CIOS XXXIII-55. *Coke Ovens in the Ruhr and Watenstedt Districts.*

CIOS XXXIII-56. *Blast Furnaces in the Ruhr and at Watenstedt.*

CIOS XXXIII-57. *German Open Hearth Furnace Refractories.*

CIOS XXXIII-58. *Steel Foundries.*

CIOS XXXIII-59. *German War List for Ferrous Materials (Kreigsliste).*

CIOS XXXIII-60.

CIOS XXXIII-61. *Segregation in Centrifugally Cast Gun Tubes.*

CIOS XXXIII-62. *Centrifugal Casting of Crank Cases—Middle Parts.*

CIOS XXXIII-63. *The Production of Steel Shells and Cartridge Cases at Hak Hanseatisches Kettenwerk, Hamburg-Langenhorn.*

CIOS XXXIII-64. [AR coatings, microscopes]

CIOS XXXIII-65. *The Design and Manufacture of Fire Control Gears.*

CIOS XXXIII-66. *Visit to the Chemische Und Physische Versuchs Anstalt of Kiel, Evacuated to Danisch Nienhof.*

CIOS XXXIII-67. *Rangefinders, Tank Sights and Naval Sights.*

CIOS XXXIII-68. *Developments in the Design of Propulsion Units of German Naval Vessels.*

CIOS XXXIII-69. *Schott and Genossen of Jena.* [Schott glass, mirrors]

CIOS XXXIII-70. *Rolling Mills.*

CIOS XXXIII-71. *Tyre, Tube and Heavy Plant Manufacture.*

CIOS XXXIII-72. *Drop Forgings.*

CIOS XXXIII-73. *Designs of German Pumping Equipment.*

Field Information Agency, Technical (FIAT) Final Reports

Note: There are several cases in which one FIAT report was given two different numbers. There are an inexplicably large number of cases in which two different, unrelated FIAT reports were assigned the same number. If fact, there may well be additional FIAT final reports that are not listed here but that have the same number as a different report that is listed. It is unclear if the numerical mayhem was due to administrative carelessness by FIAT, or if there were intended to be two different series of FIAT final reports, or if more mundane reports with a given number were used as an unclassified placeholder to help conceal the existence of then-classified reports with the same number.

FIAT 1. *Investigation of Machine Tool Practice of M.A.N. at Augsburg, Germany.*

FIAT 2. *Investigation of Gear Manufacture of Zahnradfabrik at Augsburg, Germany.*

FIAT 3. *Investigation of Machine Tools of Adam Opel at Russelsheim, Germany.*

FIAT 4. *German Infrared Targets in South Germany and Austria.*

FIAT 4. *Investigation of Measuring Instruments, Gages and Cutting Tools.*

FIAT 5. *Interrogation of General Gerhard Rose, Vice-President of the Robert Koch Institute,*

Berlin, and Chief Consultant in Tropical Medicine to the German Air Force.

FIAT 6. *Viscose Making at Suddeutsche Zellwolle A.G. Kelheim.*

FIAT 7. *Rayon Tow (Spinnband) and Staple in the Worsted Spinning Industry. Augsburger Kammgarm Spinnerei, Augsburg.*

FIAT 8. *Investigation of Textiles, I.G. Farbenindustrie Bobingen.*

FIAT 9. *Investigation of Scientific and Laboratory Glassware Area of Thuringia, Germany.*

FIAT 10. *Continuous Process for Spinning Viscose Yarn at Zellwolle Lenzing Aktiengesellschaft Lenzing, Oberdonau, Austria.*

FIAT 11. *German Military Water Supply Equipment.*

FIAT 12. *Preparation of Acetic Anhydride from Acetylene at Alexander Wacker Company, Burghausen.*

FIAT 13. *Manufacture of Soromin S.G. at I.G. Farbenindustrie Gendorf.*

FIAT 14. *Status of I.G. Work on the Preparation of Acrylonitrile at I.G. Farbenindustrie, Gendorf.*

FIAT 15. *Research on the Cyclopoly Olefines at I.G. Farbenindustrie Gendorf.*

FIAT 16. *P.C. Fibers. I.G. Farbenindustrie Wolfen.*

FIAT 17. *Spinning of Yarn for Tire Cord at I.G. Farbenindustrie Filmfabrik Wolfen.*

FIAT 18. *Documents Relating to Duck Weaves, Adhesion of Rubber to Fiber, Textile Finishes, at VAL Mehler Segeltuchweberi, Fulda.*

FIAT 19. *Viscose Staple Fiber (Spinning) at Lonziger Zellwolle Fabrik, A.G. Lenzing, Ost.*

FIAT 20. *Textile Research Department, Dr. Alexander Wacker G.m.b.H., Burghausen.*

FIAT 21. *Documents Relating to Cottonizing and Bleaching Bast Fibers at I.G. Farbenindustrie Sauerstoff-Werke, Griesheim.*

FIAT 22. *Viscose Rayon Staple Manufacture at Shia Viscosa Cesana Maderno (Milano).*

FIAT 23. *Viscose Rayon Staple Manufacture at Shia Viscosa Cesana Maderno (Milano).*

FIAT 24. *“Animalized” Viscose and Acetate Staple at I.G. Farbenindustrie, A.G., Bobbingen, Höchst and München.*

FIAT 25. *Synthetic Fiber-Forming High Polymers at Kaiser Wilhelm Institut für Physikalische Chemie Berlin Dahlem.*

FIAT 26. *Raw Materials Used in German Iron and Steel Industry.*

FIAT 26. *Manufacture of Viscose Yarn, Staple Fibre and Artificial Horsehair at Spinstoff Fabrik Berlin-Zehlendorf.*

FIAT 27. *“Cottonin” or Cottonized Flax, 3rd Army Intelligence Center Freising.*

FIAT 28. *Making of Acetic Anhydride by Pyrolysis of Acetic Acid at C.S. Boehringer & Sohne,*

Mannheim-Waldorf.

FIAT 29. *Manufacture of Acetic Anhydride at Consortium für Elektrochemie, Hollriegelskreuth.*

FIAT 30. *Polyvinyl Chloride Manufacture—Vinol HH at Alexander Wacker, Burghausen.*

FIAT 31. *Manufacture of Rayon Tire Yarn, Cord and Fabric at Pirelli S.P.A. Azienda Tessile Artificial Pizzaghetone, Italy.*

FIAT 32. *Acetic Anhydride, Cellulose Acetate Production and Weak Acid Recovery at I.G. Farben Dormagen.*

FIAT 33. *Production of Cellulose Acetate Staple, Cellulose Acetate, Acetic Anhydride, and Acetic Acid at Alexander Wacker Electrochemische Industrie Burghausen.*

FIAT 34. *Preparation of Cuprammonium Spinning Solution, Production of Cuprammonium Staple and Specialties, Recovery of Copper and Ammonia at I.G. Farbenindustrie, Dormagen.*

FIAT 35. *Bobbin Spinning Process of Viscose Rayon Textile Yarn and of Yarn for Tire Cord at Shia Viscosa Cesana Maderno.*

FIAT 36. *Staple Fiber Production, "Vistra", Normal and High Tenacity at I.G. Farbenindustrie A.G. Wolfen.*

FIAT 37. *Electrical Equipment Manufacturing Industry of Germany.*

FIAT 37. *Perlon U; Polyurethanes at I.G. Farbenindustrie A.G., Bobingen, Augsburg.*

FIAT 38. *Investigation of Insecticide and Insectifuge Research and Manufacture in Western Germany.* [DDT, repellants, disinfectants]

FIAT 38. *Explosive Tests on Salt Mines Utilized for Underground Ammunition Storage.*

FIAT 39. *Spinning Tire Yarn, Vereinigte Glanzstoff Fabriken, Obernburg a. Main.*

FIAT 40. *Treatment of Fabric with Formaldehyde and Analogous Compounds at Wendels Bleiche, Near Bielefeld.*

FIAT 41. *The Character of Some Finishing and After Treatment Agents at I.G. Farbenindustrie, Höchst.*

FIAT 42. *Performance and Application of the Various Staples Manufactured in Germany, Zellwolle Lehrspinnerei, Denkendorf, Germany.*

FIAT 42. *German "Kung Method" for Excavating Tunnels.*

FIAT 43. *German Mountain Engineer Equipment.*

FIAT 43. *I.G. Breaking Machine for Rayon Tow in the Worsted Spinning Industry Döhern Kammgarm Spinnerei—Hannover.*

FIAT 44. *New Fibers and Their Applications in Germany During the War Period.*

FIAT 44. *Liquid Fuels Installations at German Airports.*

FIAT 45. *Viscose Making Methods at Obernburg.*

FIAT 46. *Calendaring Machine for Luvitherm Film at Kleinewefers and Son, Krefeld.*

FIAT 46. *Data on the German X-Ray Industry.*

FIAT 47. *German Military Bridges.*

FIAT 47. *The Properties of Platinum-Gold Alloys with Reference to Hardening and Spinneret Manufacture at W.C. Hereaus G.m.b.H. Hanau.*

FIAT 48. *German Airfield Design and Construction Methods.*

FIAT 48. *Viscose Tire Yarn Manufacture at I.G. Farbenindustrie, Rottweil, Wurtemburg.*

FIAT 49. *Manufacture of Lanusa, I.G. Farben, Ludwigshafen-Oppau.*

FIAT 49. *Some Documents and Catalogs of German Coal-Fired Heating and Cooking Stoves Manufactured During, or Just Before, the War.*

FIAT 50. *Observations on the German Fruit Juice Industry.*

FIAT 50. *General Developments in the German Staple Fiber Industry at I.G. Farbenindustrie, Höchst, Wolfen, Munchen; Phrix Konzern, Krefeld, Siegburg; Zellwolle and Kunstseide, Schwarze, Lenzing.*

FIAT 51. *Comparison of German Continuous Alkali Cellulose Processes, Vereinigte Glanzstoff, Obernburg and Kelsterbach, Spinnstoff Fabrik, Berlin-Zehlendorf.*

FIAT 51. *Developments in the German Preserves Industry During World War II.*

FIAT 52. *Viscose Spinning, Kampf and Spindler, Hilden, Near Düsseldorf.*

FIAT 53. *Phrix Krefeld Viscose Process Details at Rheinische Kunstseide, Krefeld.*

FIAT 54. *Werner and Pfleiderer, Viscose Making Machinery at Stuttgart-Feuerbach.*

FIAT 54. *German Developments in Semi-Conducting Materials.* [by T. M. Odarenko]

FIAT 55. *Viscose Preparation, Rheinische Zellwolle, Phrix Arbeitsgemeinshaft, Siegburg.*

FIAT 55. *German "Upon" Universal Milling Machine.* [by T. M. Odarenko]

FIAT 56. *Sulphate Dissolving Pulp for Rayon Manufacture, Kostheim, Obernburg, Darmstadt.* With seven supplements.

FIAT 56. *Selenium Rectifier Development in Germany.* [by T. M. Odarenko]

FIAT 57. *Use of Synthetic Fibers in Rubber Tires at Continental Gummiwerke, Hannover.*

FIAT 57. *12-Channel Long-Distance Voice-Frequency Telegraph System.* [by T. M. Odarenko]

FIAT 58. *Leather Tanning at Idesteiner Lederwerke, Landauer & Donnet, A.G.*

FIAT 58. *Spectrographic Monitoring Equipment for Radio Stations.* [by T. M. Odarenko]

FIAT 59. *Regenerated Cellulose Films at I.G. Farben (Kalle) Wiesbaden-Biebrich.*

FIAT 59. *Synchronized Broadcasting Systems in Upper Austria: Principle of Operation.* [by T. M. Odarenko]

FIAT 60. *Observations at A.K.U. Staple Plant, at Arnhem, Holland.*

FIAT 60. *Development Work on Radar Antennae in Germany.* [by T. M. Odarenko]

FIAT 61. *Cuppramonium Rayon Continuous Process. I.G. Farbenindustrie, Dormagen.*

FIAT 61. *Radar Camouflage Radiation Absorption Materials.* [by T. M. Odarenko]

FIAT 62. *I.G. Work on Polyamides, I.G. Farben, Ludwigshafen.*

FIAT 62. *Radio-Frequency Transmission Lines and Dielectric Materials.*

FIAT 63. *Activities of the Second Institute of Physics of the University of Vienna.* [by T. M. Odarenko; the original German version of this report is G-345]

FIAT 63. *Manufacture of Cellulose Acetate Flake and Yarn. Rhodiaseta A.G., Freiburg, Germany.*

FIAT 64. *Staple Fiber (Spinning) at Thüringsche Zellwolle, A.G. Schwarza.*

FIAT 64. *Preparation of the Dyestuffs Filterblaugrun Spritloslich and Filterblaugrun Wasserlosloch.*

FIAT 65. *Manufacture of Dissolving Pulp by the Sulphite and Nitric Acid Processes at I.G. Farbenindustrie, Wolfen.*

FIAT 65. *Continuous Vulcanizing Machine Manufactured by Hermann Berstorff Machinenbau Anstalt, G.m.b.H., Hannover.*

FIAT 66. *Production of Viscose Yarn, Vereinigte Glanzstoff, Kelsterbach.*

FIAT 66. *Glossary of Some German Names for Chemical Products Used in the Paint, Varnish and Lacquer Industry.*

FIAT 67. *Chemical Developments and Applications in the Synthetics Industry of Germany.*

FIAT 67. *Research on Shock Loading of Aircraft and Related Equipment.*

FIAT 68. *Institute for Materials Research, Sonthofen/Allgau.*

FIAT 69. *Powder Metallurgy.*

FIAT 70. *Dr. Ing. Kurt Laue and Wife, Wutöschingen/Baden.*

FIAT 70. *Some Notes from the Interview of Mr. Berendt of Blohm & Voss on the Blohm & Voss System of Oil Burning in Marine Boilers and an Ignition Starter for Cold Boiler Starting.*

FIAT 71. *Medical Targets in Central and Southern Germany.* [hormones, adrenichrome, etc.]

FIAT 72. *German Surgical Instrument Manufacturing in the Solingen and Tuttlingen Districts.*

FIAT 73. *I.G. Farbenindustrie, Behringwerke, Marburg A/L.*

FIAT 74. *Alfred Teves Maschinen u. Armateuren Fabrik G.m.b.H., Frankfurt (Fechenheim), Ger-*

many.

FIAT 75. *Summary Report on Food and Agriculture Targets.*

FIAT 76. *Chemical Institute, Heidelberg University.*

FIAT 77. *Interrogation of Research Workers at Agricultural High School.*

FIAT 78. *German Tobacco, Experiment Station (Reichsanstalt für Tabakforschung) at Forchheim Near Karlsruhe.*

FIAT 78. *High Frequency Technical Ceramic Materials of Germany.*

FIAT 79. *Research Activities (Health and Nutrition) of the Kaiser Wilhelm Medical Research Institute at Heidelberg.*

FIAT 80. *Forschungsinstitut für Getreidechemie, Eberstadt (Darmstadt), Germany.*

FIAT 81. *Centrifugal Casting of Metals in Germany.*

FIAT 82. *Summary Report on German Research and Technology in Food.*

FIAT 83. *Ersatzverpflegungsmagazin, Bremen, Germany.*

FIAT 84. *Plenofa Werke Ruegamer and Co., Hamburg-Altona, Germany.*

FIAT 85. *J. Pleser Sonne Hefefabrik, Darmstadt, Germany.*

FIAT 86. *The Use of Wood in the Construction of German Torpedo Boats (E-Boats and Hydro-Boats).*

FIAT 87. *Building Materials and Construction.*

FIAT 88. *Gesellschaft für Lindes Eismaschinen A.G., Wiesbaden.*

FIAT 89. *Metallurgical and Industrial Developments in Magnesium.* [Zirconium alloys]

FIAT 90. *Interrogation of Professor Franz Fischer.*

FIAT 91. *Interrogation of Dr. Heinrich Messer, Bensheim, Germany.*

FIAT 92. *German Processing of Fats, Oils and Oilseeds.* [Synthetic fats, carotene]

FIAT 93. *Schofferhof-Binding Brauerei, A.G., Frankfurt am Main.*

FIAT 94. *Agricultural Library of the Landwirtschaftliche Hochschule at Bonn.*

FIAT 95. *The Power Industry in Germany.*

FIAT 96. *Water Supply, Sewage, and Industrial Waste Treatment.*

FIAT 97. *Machine Investigation and Assessments.*

FIAT 98. *Chocolate, Coffee, Baking Targets.*

FIAT 99. *Mining Thin Steeply Pitching Seams and the Operation of Diesel Locomotives Underground, Mine Bochum/Ruhr.*

FIAT 100. *German Airframe Tooling—General.*

FIAT 101. *Report on Alternating Current Deck Winch Built for MS's Ostmark & Steiermark for Installation at Fried, Krupp, Germaniawerft A.G. Kiel.* With supplement.

FIAT 102. *New Radial Flow Turbine Design.*

FIAT 103. *C. H. Knorr A.G., Heilbronn, Germany.*

FIAT 104. *Survey of the Arc Carbon Industry of Germany.*

FIAT 105. *Survey of Manufacture of Graphite Rudders for V-2 Rockets.*

FIAT 106. *Landwirtschaftliche Hochschule, Hohenheim.*

FIAT 107. *Cold-Ray Pasteurization of Milk.* [Synthetic human milk]

FIAT 108. *Miss Lieselotte Wirth, Heidelberg.*

FIAT 109. *Schofferhof-Binding-Brauerei Aktgesellschaft, Frankfurt.*

FIAT 110. *Mühlenchemie G.m.b.H., Frankfurt.*

FIAT 111. *Heilan G.m.b.H., Frankfurt.*

FIAT 112. *Novopan G.m.b.H., Frankfurt.*

FIAT 113. *University of Heidelberg, Heidelberg.*

FIAT 114. *Prefabricated Housing in Germany.* [Synthetic detergents?]

FIAT 115. *Survey of the Carbon Brush Industry for Electrical Equipment in Germany.*

FIAT 116. *Report on Gears Manufactured by Kollman at Langenberg.*

FIAT 117.

FIAT 118.

FIAT 119.

FIAT 120. *Chipless Cutting.*

FIAT 121. *Mechanical Report on Precision Cutting Tool and Gage Plants in Germany.*

FIAT 122. *Report on Single Spindle Automatic Screw Machines. Indexwerke, Esslingen.* With five supplements.

FIAT 123. *Report on Motor Vehicles at the Ford Plant, Cologne.*

FIAT 124. *Synthesis of Acetone.*

FIAT 125. *Schoko-Buck Stuttgart.*

FIAT 126. *Cellulose Acetate Films at Alexander Wacker G.m.b.H., Burghausen, Germany.*

FIAT 127. *Report on Continuous Viscose Making at Thuringische Zellwolle A.G. Schwarza, Ger-*

many.

FIAT 128. *Acetic Acid Recovery at Alexander Wacker G.m.b.H., Burghausen, Germany.*

FIAT 129. *Continuous Viscose Making at I.G. Farbenindustrie A.G., Wolfen, Germany.*

FIAT 130. *Manufacture of Perlon at I.G. Farbenindustrie A.G. Wolfen.*

FIAT 131. *Manufacture of Spinnerets at Eilfeld A.G., Grobzig, Germany.*

FIAT 132.

FIAT 133. *Rope and Binder Twine Manufacture. Representative Plants in Northwestern Germany.*

FIAT 134. *Perlon 1-6 Hexane Diol at I.G. Farbenindustrie, Leuna, Germany.*

FIAT 135. *Viscose Stable Fiber at Sachische Zellwolle A.G., Plauen, Germany.*

FIAT 136. *Manufacture of Continuous Filament Yarn and Duraflox Staple at V. Glanzstoff Fabrik, Oderbruch, Germany.*

FIAT 137. *The Kiefer Distribution, Finishing, Pressing, and Opening Machine at Kiefer Maschinen Fabrik, Fuerbach-Stuttgart.*

FIAT 138. *Flat Knitting Machinery Improvements Developed by H. Stoll & Company, Reutlingen, Wurtemberg, Since 1935.*

FIAT 139. *Production of "Rhodiaseta" at Deutsche-Acetat Kunstseiden A.G., Freiburg, Germany.*

FIAT 140. *Spoolspinning of Viscose Rayon Yarn at Vereinigte Glanzstoff Fabriken, Elsterberg.*

FIAT 141. *Circular Warp Knitting on the Maratti Machine.*

FIAT 142. *P. C. U Polymer (Polyvinyl Chloride) PE-CE Polymer (Chlorinated Polyvinyl Chloride) at I.G. Farbenindustrie, Bitterfeld.*

FIAT 143. *Manufacture of Lyafol Film at I.G. Farbenindustrie Wolfen.*

FIAT 144. *Acetic Acid Recovery, Aceto-Butyric Acid Recovery, Propionic Acid Recovery at I.G. Farben Dormagen.*

FIAT 145. *Acetic Anhydride Production from Acetic Acid at I.G. Farbenindustrie, Dormagen.*

FIAT 146. *Viscose Development, Merkheim-Koln.*

FIAT 147. *The Behnsen Continuous Shredder, Wolfgang bei Hanau.*

FIAT 148. *Cellulose Acetate Rayon Production at Lonzona A.G. für Acetate Produkte at Säckengen.*

FIAT 149. *Staple Fiber by Viscose Process, Vistra XT, I.G. Farben, Filmfabrik, Wolfen.*

FIAT 150. *Cellulose Acetate Flake Production at Lonza Werke, Waldshut.*

FIAT 151. *Tearing of Tow of Staple Fiber to Tops at I.G. Farben, Filmfabrik, Wolfen.*

FIAT 152. *Perlon Manufacture in Germany, Johannes Kleine at Munich.*

FIAT 153. *Punching of Spinnerets, I.G. Farbenindustrie, Agfa Camera Werke, Munich.*

FIAT 154. *The German Woolen Industry.*

FIAT 155. *Relations Between German Testing and Standardizing Organizations.*

FIAT 156. *Bleaching.*

FIAT 157. *German-English Technical Dictionary for the Leather Industry.*

FIAT 158. *Investigation of Prostheses as Related to Thigh Amputation.*

FIAT 159. *Heavy Bags, Twine, and Rope.*

FIAT 160. *Sewing Machinery and Clothing Production Methods.*

FIAT 161. *Manufacture of Sutures and Ligatures at Dr. Hammer Co., Hamburg.*

FIAT 162. *Fabric Finishing Operation for Cotton and Viscose at Bleicherei Uhingen.*

FIAT 163. *Manufacture of Pressure Sensitive Adhesives and Allied Products at P. Beiersdorf and Company A.G.*

FIAT 164. *Manufacture of Sanitary Napkins and Allied Products at Camelia Works, Vereinigte Papierwerke Nürnberg.*

FIAT 165. *Manufacture of Sanitary Napkins and Surgical Dressings at Münchener Verbandstoff Fabrik Aubry.*

FIAT 166. *Manufacture of Adhesive Surgical Dressings at Sander Chemical and Pharmaceutical G.m.b.H., Munich.*

FIAT 167. *Gminde A.G. Cottonized Flax Project (Flockenbast) at Reutlingen.*

FIAT 168. *Manufacturing of Surgical Adhesive and Dressing and Artificial Limbs by Julius Teufel Company, Stuttgart.*

FIAT 169. *Manufacture of Surgical Dressing and Allied Products at Paul Hartmann Co., Heidenheim.*

FIAT 170. *Animalization and Water Proofing of Cellulose Fibers at Dormagen.*

FIAT 171. *Cellulose Esters Elberfeld.*

Joint Intelligence Objectives Agency (JIOA) Final Reports

JIOA 1. *German Underground Installations, Part One of Three, Unique Design and Construction Methods.*

JIOA 2. *German Underground Installations, Part Two of Three, Adaptations of Existing Facilities.*

JIOA 3. *German Underground Installations, Part Three of Three, Various Installations of General Interest.*

JIOA 4.

JIOA 5. *Infrared Targets at Hillersleben, Jena and Wetzlar. 19 Apr–May 4, 1945.*

JIOA 6.

JIOA 7.

JIOA 8. *German 200 cm. Searchlight Model 43.*

JIOA 9. *German Vacuum Evaporation Methods of Producing First Surface Mirrors, Semi-transparent Mirrors and Non-reflecting Films.*

JIOA 10. *Investigation of German Searchlight Equipment.*

JIOA 11. *German Military Water Supply Equipment (Research and Development).*

JIOA 12.

JIOA 13. *Photo-Mapping and Map Reproduction.*

JIOA 14. *Germany Army Geologists and Terrain Intelligence Specialists.*

JIOA 15. *Rammelsberg Lead-Zinc Mine.*

JIOA 16.

JIOA 17.

JIOA 18. *Engineering Geology in Germany.*

JIOA 19. *German Construction Methods, Fabrication and Erection of Precast Concrete.*

JIOA 20. *Theodolite Manufacture.*

JIOA 21. *German Kurskoppler: Model 3040-B, Model 3040-G.* [Aircraft computer]

JIOA 22. *Report on Fire Extinguishing Systems for Military Aircraft.*

JIOA 23. *Recovery of Vanadium from Iron and Steel Plant Slags.*

JIOA 24.

JIOA 25. *Development of Mechanical Equipment in German Territory.*

JIOA 26.

JIOA 27. *German Motorized Fire Engines.*

JIOA 28. *German Air Foam Fire Fighting Equipment.*

JIOA 29.

JIOA 30.

JIOA 31.

JIOA 32.

JIOA 33.

JIOA 34. *German Chemical Fire Extinguishers.*

JIOA 35. *Report on Solid Fuels.* [not solid rocket fuels]

JIOA 36. *Engine Generator Sets Standardized by the German Army and Air Force.*

JIOA 37.

JIOA 38.

JIOA 39.

JIOA 40. *German Oil Refineries.*

JIOA 41. *The Production of Suprifen at Farbwerke, Hoechst, Germany.* [cardiac stimulant]

JIOA 42. *German "Kunz Method" for Excavating Tunnels.*

JIOA 43. *German Mountain Engineer Equipment.*

JIOA 44.

JIOA 45. *Industrial Safety in Germany.*

JIOA 46. *Data on the German X-Ray Industry.*

JIOA 47. *German Military Bridges.*

JIOA 48. *German Airfield Design and Construction Methods.*

JIOA 49. *Some Documents and Catalogs of German Coal-Fired Heating and Cooking Stoves Manufactured During or Just Before the War.*

JIOA 50. *Observations on the German Fruit Juice Industry.* [UV sterilization, enzymes for juices]

JIOA 51. *Developments in the German Preserves Industry During World War II.* [Benzoate]

JIOA 52.

JIOA 53.

JIOA 54. *German Developments in Semi-conducting Materials.*

JIOA 55.

JIOA 56. *Selenium Rectifier Development in Germany.*

JIOA 57. *12-Channel Long-Distance Voice-Frequency Telegraph System.*

JIOA 58. *Spectrographic Monitoring Equipment for Radio Stations.*

JIOA 59. *Synchronized Broadcasting Systems in Upper Austria: Principle of Operation.*

JIOA 60. *Report on Development Work on Radar Antennae in Germany.*

JIOA 61. [Radar Camouflage, Radiation Absorption Materials]

JIOA 62. *Radio-Frequency Transmission Lines and Dielectric Materials.*

JIOA 63. *Activities of the Second Institute of Physics at the University of Vienna.*

JIOA 64. *Instructions for the Preparation of the Dyestuffs Filterblaugrun Spritloslich and Filterblaugrun Wasserloslich.*

JIOA 65.

JIOA 66. *Glossary of Some German Names for Chemical Products Used in the Paint, Varnish and Lacquer Industry.*

JIOA 67. *Research on Shock Loading of Aircraft and Related Equipment.*

JIOA 68. *Miscellaneous Developments in German Science and Industry.*

JIOA 69.

JIOA 70. *Some Notes from the Interview of Mr. Berendt of Blohm and Voss on the Blohm and Voss System of Oil Burning in Marine Boilers and an Ignition Starter for Cold Boiler Starting.*

JIOA 71.

JIOA 72.

JIOA 73.

JIOA 74.

JIOA 75.

JIOA 76.

JIOA 77.

JIOA 78. *High Frequency Technical Ceramic Materials of Germany.*

Naval Technical Mission in Europe (NavTecMisEu) Final Reports

NavTecMisEu 1. *Usines Metallurgiques du Hainaut (21/3f).* [Alsos Mission Report]

NavTecMisEu 2. *Sybelae (21/3g), Usine Cockerill at Seraing, near Liege, Belgium.* [Alsos Mission Report]

NavTecMisEu 3. *Societé Generale Metallurgique de Hoboken (21/3g).* [Alsos Mission Report]

NavTecMisEu 4. *Amplifiers and Radar Detectors Made for Germans by Établissements Ora-Grandlin, Paris.* [Alsos Mission Report]

NavTecMisEu 5. *Retractable Asdic Transmitter Made for Atlas Werke, Bremen by the Industrielle des Telephones (L.I.T), Paris, France.* [Alsos Mission Report]

NavTecMisEu 6. *German Submarine Detection Registration Device, Periscope, and Part of German Anti-Aircraft Gun Sight Made for the Germans by Sadir-Carpentier Puteaux near Paris.* [Alsos Mission Report]

NavTecMisEu 7. *Re-visit to OPA, 91 Rue Jouffray, Paris, by O. H. Loeffler, USNR.* [Alsos Mission Report]

NavTecMisEu 8.

NavTecMisEu 9. *Motor-Generator Set for Radio Transmitter and Other Items, Made by Companie des Forges and Acieries de la Marine et D'Moecourt.* [Alsos Mission Report]

NavTecMisEu 10A. *Alsos Mission Reports Prepared by Naval Members & Intelligence Report.* [Alsos Mission Report]

NavTecMisEu 10B. *German Destroyer "Z 37" Machinery Installation.* [Alsos Mission Report]

NavTecMisEu 10C. *Report of Ordnance Equipment of German Z-37 Narvik Type Destroyer.* [Alsos Mission Report]

NavTecMisEu 11. *Plans of Degaussing.* [Alsos Mission Report]

NavTecMisEu 12. *Sperrbrecher Design.* [Alsos Mission Report]

NavTecMisEu 13. *Germany—Navy—Minesweeping—Sweeps Used at Bordeaux Harbor—Description by French Technician at Bordeaux.* [Alsos Mission Report]

NavTecMisEu 14. *Germany—Navy—Minesweeping—Gear Stored in Yard at Bordeaux.* [Alsos Mission Report]

NavTecMisEu 15. *German Magnetic Minesweeping Barges Found at Le Havre.* [Alsos Mission Report]

NavTecMisEu 16. *Germany—Navy—Towed Glider Observation Arrangement for Ships.* [Alsos Mission Report]

NavTecMisEu 17. *Examination of Optical Equipment Removed from the Chateau of Brest.* [Alsos Mission Report]

NavTecMisEu 18. *Investigations of Naval Depots at Bruges, Belgium and at Boulogne, France, on 14–17 October 1944.* [Alsos Mission Report]

NavTecMisEu 19. *Submarine Engines and other Submarine Equipment in German Warehouse, Paris, France.* [Alsos Mission Report]

NavTecMisEu 20. *Retractable Submarine Noise Transmitter.* [Alsos Mission Report]

NavTecMisEu 21. *Targets in Belgium and Holland visited by Naval Electronic Field Team, 20 October—2 November, 1944.* [Alsos Mission Report]

NavTecMisEu 22. *French—Navy—Internal Combustion Engine Development.* [Alsos Mission Report]

NavTecMisEu 23. *Switzerland—Escher Wyss—Steam and Turbine Development.* [Alsos Mission Report]

NavTecMisEu 24. *German Diving Equipment.* [Alsos Mission Report]

NavTecMisEu 25. *French Underwater Gas Cutting Torch.* [Alsos Mission Report]

NavTecMisEu 26. *German Rescue Breathing Apparatus.* [Alsos Mission Report]

NavTecMisEu 27. *Submarine Engines and Other Submarine Equipment.* [Alsos Mission Report]

NavTecMisEu 28. *Optical Equipment—German—Tank and Fortification Periscopes.* [Alsos Mission Report]

NavTecMisEu 29. *Degaussing—German—Preliminary Draft Report—Part "A".* [Alsos Mission Report]

NavTecMisEu 30.

NavTecMisEu 31.

NavTecMisEu 32. *Clock Mechanism, Probably for Fuse.* [Alsos Mission Report]

NavTecMisEu 33. *Report on Activities in France. Prepared by Armand M. Morgan, Captain,*

U.S. Navy on 25 November 1944. [Alsos Mission Report]

NavTecMisEu 34. *Electronic Technical Intelligence, Targets, Investigated.* [Alsos Mission Report]

NavTecMisEu 35. *Investigation of Five Mechanical and Metallurgical Targets in the Savoy Region of France.* [Alsos Mission Report]

NavTecMisEu 36. *Visit to Ten Automobile Manufacturing Plants in the Paris Area.* [Alsos Mission Report]

NavTecMisEu 37. *Small Amphibious Vehicle.* [Alsos Mission Report]

NavTecMisEu 38. *Junkers Aircraft Engines—Plant at Strassburg in Alsace.* [Alsos Mission Report]

NavTecMisEu 39. *Documents from German Torpedo Arsenal.* [Alsos Mission Report]

NavTecMisEu 40. *Microfilm Enclosure.* [Alsos Mission Report]

NavTecMisEu 41. *German Aeronautical Research in the Brussels Area, Belgium—Forwarding of.* [Alsos Mission Report]

NavTecMisEu 42. *Investigation of German Sonne Navigational Aid Radio Station.* [Alsos Mission Report]

NavTecMisEu 43. *Fischer Tropsch Process by Ernst Nagelstein, P.W., Translated by Lt. R. C. Aldrich, USNR.* [Alsos Mission Report]

NavTecMisEu 44. *Inspection of Societe Rateau 20,000 BHP Ship's Gas Turbine.* [Alsos Mission Report]

NavTecMisEu 45. *Interrogation of M. Henri Coanda of Societe Coanda, 12 Rue Honnet, Cluchy, Paris, with enclosure of Microfilm Negative of Subject.* [Alsos Mission Report]

NavTecMisEu 46. *Technical Institutes in Strasbourg—Forwarding of.* [Alsos Mission Report]

NavTecMisEu 47. *Koenigshafen Plant of the Mannesmann Company. (Structural Assemblies for Mines, Radar, and Small Submarine Hulls).* [Alsos Mission Report]

NavTecMisEu 48. *German Submarine Torpedoes Type T IIId with LUT Mechanism.* [Alsos Mission Report]

NavTecMisEu 49. *German Torpedo Establishments at Werningen (Verny) Anzeligen, Molsheim, and Mulhausen—Investigation of.* [Alsos Mission Report]

NavTecMisEu 50. *Junkers Aircraft Motors, Including Jet Motor 004 (203)—Forwarding of.* [Alsos Mission Report]

NavTecMisEu 51. *Bomb Targets, Investigation of.* [Alsos Mission Report]

NavTecMisEu 52. *Four Mechanical Plants in and near Belfort, France: Alsthom, Peugeot, Marti and Japy—Forwarding of.* [Alsos Mission Report]

NavTecMisEu 53. *New Booster Assembly for GC Mines.* [Alsos Mission Report]

NavTecMisEu 54. *Submarine Construction at Strasbourg—Forwarding of.* [Alsos Mission Report]

NavTecMisEu 55. *The University of Strasbourg.* [Alsos Mission Report]

NavTecMisEu 56. *German Radar.* [Alsos Mission Report]

NavTecMisEu 57. *German BT Bombentorpedo.* [Alsos Mission Report]

NavTecMisEu 58. *Jet Propulsion Equipment for Bomb—Abandoned Development for German BT 1000.* [Alsos Mission Report]

NavTecMisEu 59. *The French Shale Oil Industry.* [Alsos Mission Report]

NavTecMisEu 60. *The Manufacture and Regeneration of Fischer Tropach Catalyst, Carriers-Kuhlmann Plant, Harnes, France.* [Alsos Mission Report]

NavTecMisEu 61. *Hydrogen Peroxide.* [Alsos Mission Report]

NavTecMisEu 62. *German Torpedo Motor Fluid (Ingoline).* [Alsos Mission Report]

NavTecMisEu 63-45.

NavTecMisEu 64-45. *Fusing System of German A4 Rocket (V-2).*

NavTecMisEu 65-45. *Inspection of Partially Completed Robot Bomb Factory, Located at Thill, near Esch, Luxembourg.*

NavTecMisEu 66-45. *German Aircraft Torpedoes.*

NavTecMisEu 67-45.

NavTecMisEu 68-45. *Inspection of Partially Completed Underground Factory Located at Audun Le Tiche, Meuse Department, France.*

NavTecMisEu 69-45. *German E-Boats—Miscellaneous Information—February 1945.*

NavTecMisEu 70-45. *German Diesel Engines of "FRACKE" Type.*

NavTecMisEu 71-45. *Use of Bakelite for Secondary Bulkheads in German Destroyers.*

NARA RG 243, Entry 27 I-10, Box 46 (Ebensee), Box 59 (Gaisbach, Wartberg), Box 107 (Mauthausen), Box 134 (Redl-Zipf), Box 171 (Zipf).

RG 260: Records of U.S. Occupation Headquarters, World War II

NARA RG 260, Entry A1-170, Boxes 1–15. FIAT Administrative Records, 1945–1947.

NARA RG 260, Entry A1-171, Boxes 16–21. FIAT Daily Journals, 1945–1947.

NARA RG 260, Entry A1-172, Boxes 22–23. FIAT Index Card File, 1946–1947.

NARA RG 260, Entry A1-173, Boxes 24–44. FIAT General Records, 1945–1947.

NARA RG 260, Entry A1-174, Boxes 45–46. FIAT Document Evaluation Forms, 1946.

NARA RG 260, Entry A1-175, Boxes 566–575. FIAT Administrative, Program, and Publications Files.

NARA RG 260, Entry A1-224, Box 101. [Reichspost.]

NARA RG 260, Entry A1-455, Box 649. [Messerschmitt Oberammengau.]

NARA RG 260, Entry A1-1573, Boxes 506–508. [Records Relating to German Scientists.]

NARA RG 260, Entry ??, Box 20-3/5. OMGUS (U.S. Office of Military Government for Germany) Historical Office. History of Field Information Agency, Technical (FIAT). Period 8 May 1945–30 June 1946. Period 1 July 1946–30 June 1947. [4994 FIAT investigators visited Germany during that 12-month period]

NARA RG 260, Microfilm Roll 0084. Records of the German External Assets Branch of the U.S. Allied Commission for Austria Section, 1945–1950.

RG 263: Records of the Central Intelligence Agency

NARA RG 263, Entry ZZ-16. CIA Name Files First Release.

NARA RG 263, Entry ZZ-18. CIA Name Files Second Release.

RG 298: Records of the Office of Naval Research

NARA RG 298, Entry UD-1, Boxes 66–67.

RG 319: Records of the Army Staff

NARA RG 319, Entry A1-84E, Box 124. [BID 8600.0711 Nuclear Physics (Atomic Energy)—Uses—Rockets. History of German Trans-Atlantic Rocket A-10. 4 March 1947.]

NARA RG 319, Entry A1-134A (Records of the Investigative Records Repository [IRR], Impersonal File).

NARA RG 319, Entry A1-134B (Records of the Investigative Records Repository [IRR], Personal Name File).

NARA RG 319, Entry NM3-47B, Box 991, Folder Implementation, General Policy & History.

NARA RG 319, Entry NM3-58, Box 7. Folders 1. TO: CZECHOSLOVAKIA 9-16-45–12-31-45 and 1. FR: CZECHOSLOVAKIA... (MISC) 9-3-45–12-31-45.

NARA RG 319, Entry NM3-82 (Publication Files), especially Boxes 375–426 [BIOS Evaluation Reports and Final Reports], Boxes 668–695 [CIOS Final Reports], Boxes 1264–1283 [FIAT Final Reports], Boxes 1545–1547 and 1622 [Guided Missiles], Boxes 1550–1621 [Halstead Exploitation Centre (HEC) Reports], Boxes 1674–1684 [German documents collected by Alsos Mission], Boxes 2151–2153 [JIOA], Box 2879 [Project 2784].

NARA RG 319, Entry NM3-82A, Boxes 1–19. [German documents collected by Alsos Mission.]

NARA RG 319, Entry NM3-85A (Army Intelligence Document File), especially Box 2126 (Folder 324361–324370), Box 2144 (Folder 326851–326860), Box 2534 (Folder 390731–390740).

NARA RG 319, Entry NM3-85M, Box 19. Folders 925253 and 925256. [Czechoslovakia.]

NARA RG 319, Entry UD-57, Boxes 76–81. [Wernher von Braun.]

NARA RG 319, Entry UD-151. [Counter Intelligence Corps.]

NARA RG 319, Entry UD-1080. [Counter Intelligence Corps.]

NARA RG 319, Entry UD-1041, Box 27, Folder 925497. [The Commanders Intelligence Digest. 19 January 1945.]

NARA RG 319, Entry ZZ-5 (Records of the Investigative Records Repository [IRR], Selected Personal Name Files).

NARA RG 319, Entry ZZ-6 (Records of the Investigative Records Repository [IRR], Selected Impersonal Files).

RG 326: Records of the Atomic Energy Commission

NARA RG 326.

RG 330: Records of the Office of the Secretary of Defense

NARA RG 330, Entry A1-1A, Boxes 1–43. General Correspondence of the Joint Intelligence Objective Agency (JIOA). 1946–1952.

Archival location??? Objective List of German and Austrian Scientists. (1,600 “Scientists”). 2 January 1947. https://www.smecc.org/heinz_muller/german_and_austrian_scientists_interrogated.pdf

NARA RG 330, Entry A1-1B, Boxes 1–186. JIOA Foreign Scientist Case Files. Index of names and boxes available online: https://www.archives.gov/files/iwg/declassified-records/rg-330-defense-secretary/foreign-scientist-case-files.pdf

NARA RG 330, Entry A1-1C, Boxes 1–3. Defense Scientist Immigration Program (DEFSIP) Administrative Records.

RG 331: Records of Allied Operational and Occupation Headquarters, World War II

NARA RG 331, Entry UD-13D. [CIOS reports.]

NARA RG 331, Entry NM8-18, Boxes 142–144. Subject File, 1944–45 (Re: Target Lists And Reports Of Target Teams, 1944–45). [FIAT records.]

NARA RG 331, Entry 83D, Box 33. Folder Com. Z. Releases: 1 May to 30 June 1945. John A. Keck. 28 June 1945 press release.

RG 341: Records of Headquarters United States Air Force (Air Staff)

NARA RG 341, Entry NM15-44 (Historical Branch Subject File), Box 152. Historical Studies Re: Project Paperclip.

RG 374: Records of the Defense Threat Reduction Agency

NARA RG 374, Microfilm A1218. Manhattan District History. [Available online at https://ia803409.us.archive.org/14/items/ManhattanDistrictHistory/]

RG 407: Records of the Adjutant General's Office, 1917–

NARA RG 407, Entry NM3-427 (WW II Operations Reports, 1941–48), especially Box 10127 (80th Infantry Division G-2, April 1945), Boxes 11005–11006 (89th Infantry Division G-2, April 1945), Boxes 12341–12345 (4th Armored Division, 1945), Boxes 12364–12366 (4th Armored Division G-2, April 1945), and Box 14465 (102nd Infantry Division G-2, 1945).

RG 457: Records of the National Security Agency

NARA RG 457, Entry A1-9004, Japanese Army Attaché Messages Translations, SRA 14,200 thru 15,000. SRA 14628–14632.

RG 498: Records of Headquarters, European Theater of Operations, U.S. Army

NARA RG 498, Entry UD-639, Boxes 4116–4117. FIAT Intelligence Reports, 1946.

NARA RG 498, Entry UD-640, Box 4117, FIAT [Background and] History, 1944–1946.

NARA RG 498, Roll MP63-9_0137 (Series Historical Reports and Monographs—Miscellaneous Reports), File 604k, Ordnance Section, ETO Monographs, Ordnance Technical Services, Section VI, pp. 156–181. [Report of John A. Keck after inspecting Hillersleben facility.]

GOUDS: Samuel A. Goudsmit Papers, 1943–1967

NARA RG GOUDS, Entry UD-7420, Boxes 1–9.

LRG: Leslie R. Groves Papers, 1941–1970

NARA RG LRG.

U.S. National Archives and Records Administration at Boston (NARA Boston), Waltham, Massachusetts

NARA Boston RG 181. 1st Naval District. Office of the Assistant Chief of Staff for Operations. Formerly Security Classified General Correspondence 1944–1945. Box 26. Relevant documents in three folders: Surrender of German Submarines (1 of 2); Enemy Submarines, Surrender of; U-Boats, Surrender of.

Figure Credits

Wo ein Begeisterter steht, ist der Gipfel der Welt.	Where an enthusiast is standing is the summit of the world.

Joseph von Eichendorff. 1815.
Ahnung und Gegenwart [*Idea and Present*]
Book II, Chapter 15.

In order to depict as many of the creators and creations discussed in this book as possible, this book incorporates several thousand images. I have tried to give proper attribution for the images while keeping this section as concise as I could.

Wherever possible, I have tried to use freely available images from commons.wikimedia.org. In those cases, I have identified commons.wikimedia.org but not the specific web page, because some images seem to move around at that website over time, and I do not want to give large numbers of links that may go out of date. Please use the searchable database at commons.wikimedia.org to find the current location of specific images, as well as more detailed information about those images.

To give small visual examples of scientists' research, in a few cases I have shown one page or a fraction of a page from a journal article or book that was published by a particular scientist. Those examples are drawn from images that can already be obtained on the internet for free. Most of those articles and books are nearly a century old, or in some cases even older. I have included such images for scholarly, noncommercial purposes. I am not trying to reproduce entire articles or chapters from those works, but only to provide visual evidence that those works existed. I believe this constitutes fair use.

I would like this book to be a free online resource that is as accurate and as complete as possible. If you feel that I have incorrectly used or attributed an image, please let me know. If you have images of creators or creations where I currently have only a blank space, please send me the missing images and information for how I should attribute them.

About the Author

> About 1670, religious persecution caused [his father] to uproot his home and seek refuge at Frankenstein, and here Johann Konrad was born at the castle on 10 August 1673... With his flair for disputation he soon established a reputation for brilliance, which in its turn brought adulation from fellow-students and from tutors...
>
> About 1700, Dippel became interested in the oil obtained by the destructive distillation of animal parts... The oil came to be associated with the name of Dippel through his claim that in it he had discovered a universal medicine: a large part of his M.D. thesis (*Vitae animalis morbus et medicina suae vindicata origini*, 1711) is devoted to establishing this claim...
>
> Johann Konrad ceased to hope for either university or Church appointments, and removed himself to Berlin to follow an alchemical career... Further evidence about Dippel's relationships with other chemical workers emerges from the story of Prussian blue...
>
> The remainder of the old philosopher's life was lived out in comparative obscurity... As a guest of the Duke of Wittgenstein-Gützow, he was provided with a laboratory at Wittgenstein Castle... A last flamboyant gesture of fantasy in the face of reality was his prediction, a few months before his death, that he would live until 1808.
>
> E. E. Aynsley and W. A. Campbell. 1962. Johann Konrad Dippel, 1673–1734.
> *Medical History* Vol. 6, No. 3, pp. 281–286.

Through reading about scientists such as Nikola Tesla, Albert Einstein, John von Neumann, Wernher von Braun, and Edward Teller, Todd Rider was inspired from an early age to pursue a career in scientific innovation, ultimately winning the Grand Prize at the 1986 International Science and Engineering Fair and filing his first patent application at age 17. He studied at MIT and Harvard 1986–1995, covering electrical engineering, nuclear engineering, mechanical and aerospace engineering, physics, biomedicine, chemistry, applied mathematics, and other areas, and received his Ph.D. in 1995. He headed the DNA sequencing program at the startup biotechnology company Aeiveos 1995–1996, became Senior Staff Scientist at MIT Lincoln Laboratory 1997–2013, and served as senior Laboratory Technical Staff at Draper Laboratory 2013–2015. In 2015 he founded the RIDER (Revolutionary Innovation, Discovery, Education, and Research) Institute.

During his career, Dr. Rider has invented a much more efficient rocket staging system and worked on antimatter rocket engine approaches; developed and tested methods of coherently combining multiple laser beams into a more powerful laser beam; discovered fundamental limitations on controlled fusion reactors; invented and demonstrated the CANARY rapid pathogen identifier; invented and developed the DRACO and PANACEA broad-spectrum antiviral therapeutics; and conducted research in various other areas. He has also worked to improve kindergarten through twelfth grade (K–12) science education, creating and running the MIT Science on Saturday program, writing educational guides for *Science News* magazine, judging state and national science fairs and competitions, and conducting presentations and hands-on lab activities on a wide range of science topics in K–12 classrooms in over 100 schools. Dr. Rider and his projects have been featured in *Science*, *Nature Biotechnology*, *Time*, *Scientific American*, *Technology Review*, *National Geographic*, *Der Spiegel*, the *New York Times*, *NBC Nightly News*, BBC, ZDF, Discovery Channel, and numerous other outlets. An inveterate acronym engineer, he has dubbed the work summarized in this book High-Yield Directed Research Approaches.

Zusammenfassung

Umwälzende wissenschaftliche Neuerungen scheint die Welt nicht länger in demselben Tempo wie früher hervorzubringen (was ganz offenkundig wird, wenn man das heutige Forschungspersonal oder die bereitgestellten Fördergelder nach revolutionären Innovationen bemisst). Statt sich an die grundsätzliche Lösung dieses systemischen Problems zu wagen, kann man genausogut untersuchen, was für Bedingungen zu anderen Zeiten und andernorts den Erfolg von Innovatoren begünstigten (Kapitel 1).

Erfindungen und Entdeckungen wurden überall und zu jeder Zeit gemacht—die größte Häufung an umwälzenden Neuerungen jedoch ist mit Wissenschaftlern und Ingenieuren verbunden, die im 19. und frühen 20. Jahrhundert in der vornehmlich deutschsprachigen Forschungslandschaft Mitteleuropas ausgebildet wurden. Durch den Ersten und Zweiten Weltkrieg, den Kalten Krieg, durch Sprachbarrieren und infolge kultureller Stereotypen verblaßte die Geschichte dieser Innovatoren und ihrer Neuerungen, so dass die moderne Welt kaum noch Einzelheiten kennt und wenig willens zu sein scheint, die Forschungsbedingungen, die einst zu so zahlreichen revolutionären Errungenschaften führten, nachzuahmen.

Die Ziele dieses Buches bestehen somit darin

- Aufklärung über die wichtigsten Schöpfer im deutschsprachigen Raum und deren Werke in verschiedenen Bereichen der Natur- und Ingenieurwissenschaften zu leisten (Kapitel 2–9),
- die systemischen Faktoren zu ermitteln, die in diesem Raum so zahlreiche revolutionäre Innovationen hervorbrachten (Kapitel 10),
- erfolgreiche, aber auch fehlgeschlagene Anläufe einer Übertragung des Wissens und der systemischen Faktoren auf andere Forschungslandschaften zu bewerten (Kapitel 11),
- Methoden vorzuschlagen, mithilfe derer heutige Regierungen, Organisationen und/oder Einzelpersonen dem Erfolg des früheren deutschsprachigen Forschungsraums besser nacheifern können (Kapitel 12).

Die Archivrecherchen für dieses Buch förderten darüber hinaus zahlreiche Dokumente zutage, die darauf hindeuten, dass die deutschen Forschungsprogramme zur Zeit des Zweiten Weltkrieges in den Bereichen Biotechnik, Mikroelektronik, Technik der Energiewaffen, Kernwaffen sowie Luft- und Raumfahrt viel fortgeschrittener waren als durch die heutige Geschichtsschreibung anerkannt wird, und dass diese Programme nach dem Krieg entsprechende Aktivitäten in anderen Ländern nach sich zogen (Anhänge A–E).

Und so, nachdem ich mir den Scherz erlaubt, dem eine Stelle zu gönnen in diesem durchweg zweideutigen Leben kaum irgend ein Blatt zu ernsthaft seyn kann, gebe ich mit innigem Ernst das Buch hin, in der Zuversicht, daß es früh oder spät Diejenigen erreichen wird, an welche es allein gerichtet seyn kann, und übrigens gelassen darin ergeben, daß auch ihm in vollem Maaße das Schicksal werde, welches in jeder Erkenntniß, also um so mehr in der wichtigsten, allezeit der Wahrheit zu Theil ward, der nur ein kurzes Siegesfest beschieden ist, zwischen den beiden langen Zeiträumen, wo sie als paradox verdammt und als trivial geringgeschätzt wird. Auch pflegt das erstere Schicksal ihren Urheber mitzutreffen.—Aber das Leben ist kurz und die Wahrheit wirkt ferne und lebt lange: sagen wir die Wahrheit.

Arthur Schopenhauer. 1819. *Die Welt als Wille und Vorstellung.* 1. Auflage. Leipzig.

Abstract

The world does not appear to be producing truly revolutionary scientific innovations at the same rate as it once did (certainly if measured in terms of revolutionary innovations per researcher or per amount of funding). Rather than trying to create solutions for this modern systemic problem from scratch, one may study what conditions facilitated the successes of innovators in other times and places (Chapter 1).

Inventions and discoveries have been made throughout the world and throughout history, yet the highest concentration of revolutionary innovations appears to have come from scientists and engineers who were trained in the predominantly German-speaking central European research world in the nineteenth and early twentieth centuries. Unfortunately, the history of those innovators and innovations has been significantly obscured by World Wars I and II, the Cold War, language barriers, and cultural stereotypes, leaving the modern world less aware of the details and less able to fully reproduce the research conditions that led to so many revolutionary achievements.

Therefore the objectives of this book are to:

- Elucidate the major creators and creations produced by that German-speaking world in various fields of science and engineering (Chapters 2–9).
- Determine the systemic factors that promoted so much revolutionary innovation in that particular place and time (Chapter 10).
- Evaluate the previous successes and failures of transferring that scientific knowledge and those systemic methods to other research systems (Chapter 11).
- Propose methods by which modern governments, organizations, and/or individuals could better emulate the success of the earlier German-speaking research world (Chapter 12).

Archival research for this book also yielded many documents that suggest that World War II German programs in biotechnology, microelectronics, directed energy technologies, nuclear weapons, and aerospace technologies progressed much further than has been acknowledged in conventional histories, and that they aided postwar programs in other countries (Appendices A–E).

And now that I have allowed myself the jest to which in this ambiguous life hardly any page can be too serious to grant a place, I part with the book with deep seriousness, in the sure hope that sooner or later it will reach those to whom alone it can be addressed; and for the rest, patiently resigned that the same fate should, in full measure, befall it, that in all ages has, to some extent, befallen all knowledge, and especially the weightiest knowledge of the truth, to which only a brief triumph is allotted between the two long periods in which it is condemned as paradoxical or disparaged as trivial. The former fate is also wont to befall its author.—But life is short, and truth works far and lives long: let us speak the truth.

Arthur Schopenhauer. 1819. *The World as Will and Representation.* 1st ed. Leipzig.
